FOREWORD

Kenya Climate-Smart Agriculture Project (KCSAP) tasked the Kenya Agricultural and Livestock Research Organization (KALRO) with the implementation of the project's Component 2 on 'Strengthening Climate-Smart Agricultural Research and Seed Systems'. The component activities are geared towards the development, validation, adoption and delivery of context specific climate smart agriculture (CSA) technologies, innovation and management practices (TIMPs). It is also responsible for development of sustainable seed production and distribution systems of priority agricultural value chains to enhance availability and access improved seeds, animal breeds and fingerlings by target beneficiaries. Against this background, KALRO and her National Agricultural Research System (NARS) partners have developed, validated and availed CSA TIMPs for dissemination and adoption. This document provides a detailed inventory of TIMPs that have been developed in Green Gram value chain.

Extensive information from research and background data has been used to develop this TIMPs inventory. To disseminate the TIMPs, a Training of Trainers (ToT) manual has been developed. The design of the manual takes into consideration the delivery system, partners and their roles, duration of training and logical flow of the modules. The training modules have uniform outline that ensures every aspect of the TIMPs are fully covered in way that the trainees can absorb and relate to. Various delivery methods are deployed and where possible demonstrations and practical work are incorporated to enable the trainees learn by participating in the actual field activities. The use of this TIMPs inventory is expected to contribute to achievement of the envisaged KCSAP's project 'Triple Wins' of increased productivity, enhanced resilience and reduction of greenhouse gases emissions. Thus, this TIMPs inventory is to be used in conjunction with the respective Green Gram ToT Manual.

Finally, I am greatly indebted to the value chain leaders and all those who participated in the preparation of this inventory of TIMPs. It is expected to herald new ways of delivering training content that will enable realization of the project objectives and aspirations.

Eliud K. Kireger, PhD, OGW Director General, KALRO

PREFACE

The Kenya Climate-Smart Agriculture Project (KCSAP) is a Government of Kenya project with support from both the World Bank and the government. The project runs for five years and implemented in 24 counties, mainly in the arid and semi-arid lands (ASALs), at an approximate cost of KES 25 billion. The project development objective (PDO) is "to increase agricultural productivity and build resilience to climate change risks in the targeted smallholder farming and pastoral communities, and in the event of an Eligible Crisis or Emergency, to provide immediate and effective response." This objective is to be achieved through the implementation of five key components, which are: 1) Upscaling Climate-Smart Agricultural Practices, 2) Strengthening Climate-Smart Agricultural Research and Seed Systems, 3) Supporting Agro-weather, Market, Climate, and Advisory Services, 4) Project Coordination and Management and 5) Contingency Emergency Response.

Component 1 involves facilitating the empowering of farmers and communities to adopt technologies, innovations and management practices (TIMPs) to achieve the Climate Smart Agriculture (CSA) triple-wins of; increased productivity, enhanced resilience (adaptation), and reduced Greenhouse gas (GHG) emissions (mitigation). Component 2 is tasked with the responsibility of providing the TIMPs. Therefore, it supports the development, validation, and adoption of context specific CSA TIMPs to target beneficiaries under Components 1 and 3.

To catalyze uptake of TIMPs, Kenya Agricultural and Livestock Research Organization (KALRO) in conjunction with partners in the National Agricultural Research Systems (NARS) and Consultative Group for International Agricultural Research (CGIAR) compiled inventories of TIMPs for the prioritized value chains. The crop-based value chains are 19 and include roots and tubers (cassava, potato), pulses (dry beans, green gram and pigeon peas), vegetables (tomato, onion, indigenous vegetables, kale and mango), cereals (sorghum, millet, maize, teff) nuts (mango nut), fruits (banana, mango, water melon) and fibre (cotton). Those that are animal production based are five (5) and include apiculture, indigenous chicken (meat and eggs), dairy (cattle and camel), red meat (cattle, sheep and goats) and aquaculture. Also, there are three (3) cross cutting themes on pastures and fodder, natural resource management, and animal health. The TIMPs have been categorized into those ready for upscaling and those requiring validation. Furthermore, gaps that required further research and development of TIMPs have been identified. Training of Trainers' (ToT) manuals focusing on TIMPs that are ready for upscaling for each of the value chains have been subsequently developed to form the basis of training county extension staff, service providers and lead farmers. Those trained are in turn expected to cascade the training to beneficiaries in the targeted smallholder farming, agro-pastoral and pastoral communities in the 24 project counties of Marsabit, Isiolo, Tana River, Garissa, Wajir, Mandera, West Pokot, Baringo, Laikipia, Machakos, Nyeri, Tharaka Nithi, Lamu, Taita Taveta, Kajiado, Busia, Siaya, Nyandarua, Bomet, Kericho, Kakamega, Uasin Gishu, Elgeyo Marakwet and Kisumu.

KALRO, having the responsibility of implementing the activities under Component 2, has been instrumental in using its information resources and those of partners and collaborators to come up with the inventories of TIMPs and corresponding ToT manuals. Use of these information resources coupled with the accompanying training and contribution of the other project components will go a long way in enabling KCSAP to meet its development objectives.

The National Project Coordination Unit is grateful to all who participated in the development and production of this TIMPs inventory for Green Gram value chain. It is my hope that counties and other

users will put this resource to good use as they transform and reorient their agricultural systems to make them more productive and resilient while minimizing GHG emissions under the new realities of the changing climate.

INTRODUCTION

Greengram is an important pulse crop commonly grown and consumed by rural and urban communities in Kenya and contributes about KES 32 billion to the Kenyan economy. It is used in several food products, both as a whole grain and in processed form. It also an excellent source of high quality protein with high digestibility. Greengram is considered to be the most hardy of all the pulse crops and is suitable for drought prone areas where many other crops cannot grow. It is mainly grown for sale in local and export markets and also for food and is increasingly becoming recognized as an excellent part of a healthy diet throughout Kenya. Green gram is a nutritious source of food with 24% protein content and is a comparatively low-cost source of protein. It has high levels of iron (6 mg/100 g dry seeds), which is deficient in most Kenyan diets. It is also high in fibre, various vitamins and amino acids. With more than 302,000 ha under green gram, the country produces 149,000 tons annually, which is far below the domestic demand. Over the last five years, the country has registered a 61% increase in green gram acreage from 188,000 ha in 2012 to over 302, 000 ha in 2017. This is attributed to expansion of green gram to non-traditional growing areas due to climate change. Despite its importance in drought prone environments and high demand, its yields have remained low. Moreover, green gram lessens 'hidden hunger and is a principal part of global human diet. Its starch is easier to digest than that from other legumes, has less flatulence thus it is well tolerated bychildren. . Greengram also contributes significantly to improve soil quality by fixing nitrogen in the soil. It can add up to about 30-40 kg N/ha after the harvest of the crop. Thus, after harvesting, when the greengram residues are left on the surface, the succeeding crop (normally a cereal) requires about 25% less nitrogen application. Crop residues of greengram can be used as fodder and mulch. Besides other uses, greengram can be specifically grown for hay, green manure or as a cover crop. Despite its superior nutritive value its utilization at the household level is limited due to lack of knowledge on green gram diversified products as well as limited application of improved green gram technologies innovations and management practices.

1.0 Definition of terms and summary tables of Green Grams Technologies, Innovations and Management Practices (TIMPS)

1.1 Definition of terms

Technology: This is defined as an output of a research process which is beneficial to the target clientele and (mainly farmers, pastoralists, agro-pastoralists and fisher folk for KCSAP's case), can be commercialized and can be patented under intellectual property rights (IPR) arrangements. It consists of research outputs such as tools, equipment, genetic materials, breeds, farming and herding practices, gathering practices, laboratory techniques, models etc.

Management practice: This is defined as recommendation(s) on practice(s) that is/are considered necessary for a technology to achieve its optimum output. These include, for instance, different agronomic and practices (seeding rates, fertilizer application rates, spatial arrangements, planting period, land preparation, watering regimes, etc.), protection methods, for crops; and feed rations, management systems, disease control methods, etc. for animal breeds. This is therefore important information which is generated through research to accompany the parent technology before it is finally released to users and the technology would be incomplete without this information.

Innovation: This is defined as a modification of an existing technology for an entirely different use from the original intended use e.g. fireless cooker modified to be used as a hatchery

1.2 Summary of Inventory of TIMPs in the Green Grams Value Chain

The inventory process resulted in a total of 94 TIMPs including 38 technologies, 7 innovations and 49 management practices, distributed among the 5 sub-themes, as indicated below:

Commodity/VC	Sub-Theme	Technologies	Innovations	Management
				Practices
Green grams	Improved Varieties	6	0	0
Green grams	Green gram Seed system	0	0	3
Green grams	GAP and Food Safety	0	0	2
Green grams	Agronomy	2	0	4

## 2.1. Improved Varieties

2.1.1 TIMP name	Green Gram variety KAT N26
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technolog	y, innovation or management practice
Problem to be addressed	Unavailability of suitable varieties for drier green gram
	producing areas
What is it? (TIMP description)	Kat N26 is a fairly early maturing variety (matures in 80-90
	days) and has potential yields of 1000-1500kg/ha (4-6, 90 kg
	bags/acre). The variety has a determinate growth habit, is tolerant
	to aphids, resistant to yellow mosaic and moderately resistant to
	powdery mildew. Dry pods are black in colour. 85% of the
	grains are shiny green and bold hence some farmers call it nylon

Partners/stakeholders for scaling	• Public and private extension service providers- To help in
up and their roles	the technology dissemination
	• FAO- Facilitate in the promotion of the technology and
	Inking farmers to market
	<ul> <li>NGOs:-Partner in technology dissemination</li> </ul>
	farm demonstrations
	• KILIMO trust-Capacity building of farmers and linking
	farmers to markets and credit facilities
	• Seed companies – Agri-business and marketing of the
	technology
	<ul> <li>Traders/exponents – Marketing of the technology</li> <li>Processors – For value added products</li> </ul>
	<ul> <li>Educational institutions- Providing the market</li> </ul>
	• County governments –Assist in the dissemination of the
	technology, Linking farmers to external markets
C: Current situation and future	e scaling up
Counties where already	Some parts of Makueni, Machakos, Kitui, and Tharaka Nithi.
promoted, if any	
Counties where TIMPs will be	Isiolo, Taita Taveta, Tharaka Nithi, West Pokot, Baringo, Tana
up scaled	River
Challenges in dissemination	• Limited seed systems hinder farmers from obtaining seed for
	new varieties
	• Unavailability of quality seed and high seed cost
	• Limited access to rural finance for pulse production
	• Limited processing technologies at the household level
Suggestions for addressing the	• Establish sustainable seed systems
challenges	• Avail breeder seed for seed multiplication
	Upscale innovations to reduce production costs
	Capacity building on Good Agronomic Practices
	• Involve credit facility providers in green gram value chain
	Capacity build on value addition
Lessons learned in up scaling, if	• Partnership and awareness creation are important in
any	technology dissemination and adoption
Social, environmental, policy	Continued acceptance of variety for local and foreign
and market conditions necessary	consumption
for development and upscaling	• Favourable weather
	• Enforcement of green gram production and marketing
	policies by county and national governments
	• Market availability
D: Economic, gender, vulnerab	e and marginalized groups (VMGs) considerations
Basic costs	KES 54,035/ha-
Estimated returns	Total returns under improved management were estimated at
	KES 120,000/ha and gross margins of KES 66,445/ha

Gender issues and concerns in	• Women do most of the green grams activities such as
development, dissemination	weeding and winnowing. Green gram farming therefore may
adoption and scaling up	initially increase their work burden unless there are labour-
and the second second second second	saving technologies
	• This heavy workload may limit green grams adoption and
	scaling up for women farmers who may not afford to hire
	<ul> <li>Need for gender responsive mechanization tools to ease</li> </ul>
	Need for gender responsive mechanization tools to ease     drudgery at harvesting
	<ul> <li>Women's participation in groups is important to access</li> </ul>
	services, technology, information, However, Socio-cultural
	norms may limit women's participation and leadership in
	groups which are important in accessing technology and
	information
	• Women's double and triple roles means they may not have time to participate in group activities
	• Women's status, age, wealth level may limit their influence
	and participation in groups
	• In some cultures women may not be able to travel away
	from their homes to meetings, without permission
	• Not recognizing women as farmers, therefore services and
	information are not tailored to address their priority
	• Women's time and mobility constraints mean that they may
	• women's time and mobility constraints mean that they may not be able to attend extension activities such as field days
	farmer field schools innovation platforms and agricultural
	shows far from home or held at times when they have other
	roles
	• Low literacy rates may limit use extension materials by
	women.
	• Women have limited access to improved seeds, fertilizer/
	manure and other inputs
	• Women have less access to markets than men
	women have less access to resources such as fand and capital
Gender related opportunities	• The variety is high yielding therefore will lead to increased
	productivity that will benefit all the gender categories
	(men, women and the youth)
	• The technology has high international and local demand
	therefore offers an opportunity for men and the youth who
	are mostly involved in marketing especially in far markets
	As an aprily maturing and high violding variaty it will most
	• As an early maturing and high yielding variety it will meet the food and nutrition security of all the gender categories in
	the household
	• The variety being early vielding will offer stable supplies
	and markets for women and youth
	• There will be increased sales for women and youth

	• Proper timing of agricultural meetings/field days/seminars to
	enhance participation by all the gender categories as
	informed by daily /seasonal calendars
VMG issues and concerns in	• Some VMGs might not be able to participate in some
development, dissemination	agronomic activities
adoption and scaling up	<ul> <li>Not recognizing VMG's as farmers, when designing TIMPs such as the farm implements. ## Gaps for further researcher:

- 1. Need for mechanization to ease the harvesting Thresher
- 2. Need to improve KAT N26 variety on disease resistance
- 3. Explore bio-control of insect pests white flies and aphids
- 4. Postharvest handling protection against pests e. g rat-proof cages for protection of hermetic bags
- 5. Value added green gram based products formulation of weaning diets

2.1.2 TIMP name	Green gram variety Biashara (KAT 00308)
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technolo	ogy, innovation or management practice
Problem addressed	Low green gram yields that do not meet the market demand (quality
	and quantity) due to unavailability of improved varieties
What is it? (TIMP	Biashara is an early maturing (65–75 days), high yielding (1800-2100
description)	kg/ha ([8-9, 90 kg bags/acre]) green gram variety. It is tolerant to
	aphids, resistant to yellow mosaic virus and moderately resistant to
	powdery mildew. The variety is tolerant to drought and suitable for the
	ASALs. Pods are large and cream in colour when dry. Seeds are large
	in size $(8 - 10 \text{ g}/100 \text{ seeds})$ making it easy to harvest. Grains are shiny
	green, non-stony and preferred by the market.

Justification	ASALs are characterized by frequent droughts. Green grams is a short
	season legume and can fit into cropping patterns practiced in ASALs
	(two season cropping). Farmer available varieties are low vielding and
	late maturing. Conventional varieties, however have small pods and
	small seeds that are difficult to harvest. The small seed is undesirable
	in the market This early maturing high yield nest and disease tolerant
	write will increase violds and improve livelihoods. The non-stony
	valiety will increase yields and improve invermoods. The hon-story
	grains will increase market acceptance. Due to its short growing cycle
	(65-75 days), the variety is considered less risk-prone and suitable for
	increasing resilience to impacts of climate change in the ASALs
Users of TIMP	• Farmers, Seed companies, Agro-dealers,
	Processors I raders/Exporters
Approaches to be used in	On-farm trials
dissemination	Demonstration plots
dissemination	<ul> <li>Agricultural Innovation platforms</li> </ul>

	<ul> <li>Promotional materials (posters/brochures/leaflets)</li> </ul>
Critical/essential factors for	• Establishment of sustainable seed system to ensure accessibility
successful promotion	Gender mainstreaming in green gram production
1	• Strong linkage among green gram value chain actors –producers
	to market
	Strong Partnership linkages
Donto ano /otolkok al dara far	Sustainable funding     KAL DO to provide good for the variate and hashed and is a set of the second s
Partners/stakenoiders for	- KALRO to provide seed for the variety and backstopping
scaling up and their roles	- Extension service providers (Public and private) to help in the
	technology dissemination
	- FAO to facilitate in the promotion of the technology and linking
	farmers to market
	- ICRISAT –Partner in technology dissemination

	- NGOs: –Partner in technology dissemination through on-farm
	demonstrations
	- KILIMO trust- Capacity building of farmers and linking farmers
	to markets and credit facilities
	- Seed companies –Agri-business and marketing of the technology
	- Iraders/exporters-Marketing of the technology
	- Processors - Create demand for variety unrough value addition
	- County governments – Assist in the dissemination of the
	technology, Linking farmers to external markets
C: Current situation and futu	re scaling up
Counties where already	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot, Baringo,
promoted, if any	Tana River
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot, Baringo,
be upscaled	Tana River
Challenges in development	- Limited seed systems hinder farmers from obtaining seed for
and dissemination	new varieties
	- Unavailability of quality seed and high seed cost
	- Limited access to rural finance for pulse production
	- Limited processing technologies at the household level; is
	mainly known for making stew served with cereal-based meals
Suggestions for addressing	- Need for information dissemination on GAPs
the challenges	- Participation of stakeholders along the value chain in technology
	development and on-farm validation
	- Promoting awareness among farmers about the loss of varietal
	vigor associated with recycling of saved seed
	- Upscale innovations to reduce production costs
	- Develop value added products – need to strengthen linkages
	between green gram production and consumption in local food
	systems (develop weaner diet)
Lessons learned in up scaling,	- Partnerships are important in technology dissemination and
if any	adoption
	- Increased yield can be achieved through application of water
	harvesting techniques and agro-ecological technologies
	(conservation farming like minimum tillage, mulching)
Social, environmental, policy	• -Re-establish linkage between green gram production and
and market conditions	consumption -importance in the local diet
necessary for development	• -Use of contract management to guarantee consistent supply
and upscaling	• -Increase public-private dialogue to agree on a model that will
	ensure compliance with international standards
	• Provide market information on volume, quality and supply
	consistency requirements
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations

Basic costs	The basic cost was estimated at KES 92,035/ha	
Estimated returns	Total returns under improved management were estimated at KES	
	180,000/ha and a gross margin of KES 91,445/ha	
Gender issues and concerns in	• Women do most of the green grams' activities such as weeding	
development, dissemination,	and winnowing. Green gram farming therefore may initially	
adoption and scaling up	increase their work burden unless there are labour-saving	
	technologies	
	• This heavy workload may limit green grams' adoption and	
	scaling up for women farmers who may not afford to hire labour	
	for weeding	
	• Participation in groups is important to access services, technology information However	
	<ul> <li>Socio-cultural norms may limit women's participation and</li> </ul>	
	leadership in groups which are important in accessing	
	technology and information

2.1.3 TIMP name	Green gram variety Ndengu Tosha (KAT 00301)
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technolo	bgy, innovation or management practice
Problem addressed	Low yields and a high demand for green grams for domestic and export market
What is it? (TIMP	Ndengu Tosha is early maturing (65 –70 days) and thus able to escape
description)	drought conditions that are common in the ASALs. It is high yielding
	(1800-2300 kg/ha (8-10, 90 kg bags/acre)) and tolerant to major green
	gram diseases. Its characteristic features include cream pod colour when
	dry and shiny green grains. The green gram variety grows in a wide range
	of climatic conditions from sea level to 1600 m above sea level. It is both
	heat and drought tolerant and thus can be grown in both semi-arid and
	well-watered areas. Seeds are non-stony and large in size (6-7g/100
	seeds).
Justification	ASALs are characterized by frequent droughts. Ndengu Tosha is a high
	yielding, drought tolerant and short duration crop and can fit into
	cropping patterns practiced in ASALs (two season cropping) It has
	shinny large, non-stony grains that are preferred in the market. It's
	drought tolerance and high yielding potential make it suitable for
	commercial green gram production. The variety will improve household
	income and resilience to impacts of climate change in the ASALs.
B: Assessment of dissemination	on and scaling up/out approaches

2.1.4 TIMP name	Green Gram variety Karembo (KAT 00309)
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technolo	gy, innovation or management practice
Problem addressed	Low yields and inability to meet market demand for green gram due
	to use of poor quality seeds
What is it? (TIMP	Karembo is an improved early maturing (65-75 days), high yielding
description)	(1800-2100 kg/ha 8-9, 90 kg bags/acre) green gram variety that is
	tolerant to major green gram diseases. Its other characteristic features
	include green shiny grains and large seed size (8 $-10$ g/100 seeds). Dry
	pods are brown in colour. It can grow in a wide range of climatic
	conditions. It is also both heat and drought tolerant and thus can be
	grown in both semi-arid and well-watered areas.

Justification	ASALs are characterized by frequent drought. The early maturing,
	high yielding, drought tolerance qualities of this climate-smart variety
	makes it suitable for commercial green gram production in dry land
	conditions. The large seed size (8-10g/100seeds) and non-stony grain
	qualities make it favourable for the market
B: Assessment of dissemination	on and scaling up/out approaches

	eliminates the problem of fitting the crop to both the target
	environments and users' preferences
Social, environmental, policy	- Farmer acceptance and utilization of the variety
and market conditions	- Favourable prevailing weather conditions
necessary for development	- Favourable policies that comply with the local and international
and upscaling	standards
	- Provision of improved market information on volume, quality
	and supply consistency requirements
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	The basic cost was estimated at KES 92,035/ha
Estimated returns	Total returns under improved management were estimated at KES
	180,000/ha and a gross margin of KES 91,445/ha
Gender issues and concerns in	• Women have been having low yield due to planting poor
development, dissemination	<ul> <li>Most of the activities within the green grams value chain are</li> </ul>
adoption and scaling up	labour intensive increasing work burden for women
	<ul> <li>This heavy workload may limit green grams adoption and scaling up by women farmers who may not afford to hire labour for weeding</li> <li>Need for mechanization to ease drudgery at harvesting</li> <li>Women's double and triple roles means they may not have time to participate in group activities</li> <li>Women's status, age, wealth level may limit their influence and participation in groups</li> <li>In some cultures women may not be able to travel away from their homes to meetings, without permission</li> <li>Not recognizing women as farmers, therefore services and information are not tailored to address their priority enterprises</li> <li>Low literacy rates may limit use of extension materials among women.</li> <li>Limited access to improved seeds, fertilizer/ manure and other inputs</li> <li>Women have limited access to markets than men</li> </ul>
--------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------
Gender related opportunities	- The variety is high yielding therefore will lead to increased
	women and the youth) in terms of providing employment
	- The technology has high international and local demand
	therefore offers an opportunity for men and the youth who are
	mostly involved in marketing especially in far markets
	therefore generating more income
	- As an early maturing and high yielding variety it will meet the
	household
VMG issues and concerns in development and	- Not recognizing VMG's as farmers, when designing TIMPs such as the farm implements. Therefore, need to come up with tailor made implements that meets the VMC's needs and
dissemination	concerns
	- The VMGs have less access to resources such as land and
	- VMGs have less access to extension services due to prejudice
	and their social status
	- VMGs have Limited access to improved inputs such as seeds,
	- VMGs have less access to markets than the other gender
	categories
	- Strict rules of entry and requirements of producers'
VMG related opportunities	If mechanization is introduced there will be increased
	participation by all VMGs since the work will be made easy
	- The technology can improve food and nutrition security and
	an opportunity for increased income
	- As an early maturing and high yielding variety it will meet the food and nutrition security of the VMGs in whole household.

	- It offers a good opportunity for income generation for the VMGs

2.1.5 TIMP name	Green gram variety KS 20
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technology, innovation or management practice	

Problem addressed	Low yields and poor quality grain due to unavailability of high value
	seeds
What is it? (TIMP	KS20 is a green gram variety that matures in 80-90 days and has a
description)	potential yield of 1600 - 2200 kg/ha (7-9, 90 kg bags/acre). Its
	characteristic features include large seed size (6-7g/100 seeds), dull
	green grains and pods that turn brown when dry. The variety is tolerant
	to aphids, resistant to vellow mosaic virus and moderately resistant to
	nowdery mildew Grains are dull green in color. Seeds are non-stony
	powdery mildew. Grains are dun green in color. Seeds are non-stony.
	A CONTRACTOR OF THE OWNER OWNE
	AND CITY
Justification	KS 20 is high yielding, large seeded and non stony and will increase
	production and household livelihoods in the ASALs.
Users of TIMP	- Farmers
	- Seed companies and Agro-dealers
	- Traders/Exporters
	- Other research organizations/institutions (universities)
Approaches to be used in	Processors     On-farm trials
dissemination	<ul> <li>Demonstration plots</li> </ul>
dissemination	<ul> <li>Agricultural Innovation platforms</li> </ul>
	• Farmer field days
	• Farmer to farmer visits
	Agricultural shows and exhibitions
	• Digital platforms (e.g KALRO, Weather information Apps)
	Social electronic platforms
	• Mass media (Radio and Television programmes
	Magazines and Newspapers articles)
Critical/essential factors for	- Need for good seed system to ensure accessibility
successful promotion	- Strong linkage among green gram value chain actors –producers to
	market
	- Strong partnership linkages
Partners/stakeholders for	- SIMLAW Seed Company to provide seed for the variety
scaling up and their roles	- Extension service providers (Public and private) to help in the
	technology dissemination
	- FAO facilitate in the promotion of the technology and linking
	farmers to market
	- Processors

	- County governments –Help in the dissemination of the technology,
	Linking farmers to external markets
C: Current situation and futu	re scaling up
Counties where already	• Meru, Machakos, Makueni, Kitui, Tharaka Nithi, Baringo
promoted, if any	
Counties where TIMPs will	• Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in development	- Limited seed systems hinder farmers from obtaining seed for new
and dissemination	varieties
	- Unavailability of quality seed and high seed cost
	- Limited access to rural finance for pulse production
	- Limited processing technologies at the household level; is mainly
	known for making stew served with cereal-based meals
Suggestions for addressing	- Need for information dissemination on GAPs
the challenges	- Participation of stakeholders along the value chain in technology
	development and on-farm validation
	- Promoting awareness among farmers about the loss of varietal
	vigour associated with recycling of saved seed
	- Upscale innovations to reduce production costs
	- Develop value added products – need to strengthen linkages
	between green gram production and consumption in local food
	systems (develop weaner diet)
Lessons learned in up scaling,	- Partnership is important in technology dissemination and adoption
if any	- Involvement of end-user in technology development process
	eliminates the problem of fitting the crop to both the target
	environments and users' preferences
Social, environmental, policy	- Farmer acceptance and utilization of the variety
and market conditions	- Favourable prevailing weather conditions
necessary for development	- Favourable policies that comply with the local and international
and upscaling	standards
	- Market information on volume, quality and supply consistency

up scaled	Baringo, Tana River
Challenges in dissemination	- Lack of breeder seed of yellow grams
	- Limited seed systems hinder farmers from obtaining seed for
	new varieties
	- Unavailability of quality seed and high seed cost
	- Limited access to rural innance for pulse production
	- Ennited processing technologies at the nousehold level, is mainly known for making stew served with cereal-based
	meals
Suggestions for addressing the	- Yellow gram breeder seed production
challenges	- Support informal seed system (community seed bulking) to
	ensure timely seed availability, access and affordability
	- Capacity building on Good Agronomic Practices
	- Participation of stakeholders along the value chain in
	technology development and on-farm validation
	- Involvement of credit facility providers in the value chain Conscitu build on value addition
Lessons learned in up scaling	- Partnership is important in technology dissemination and
if any	adoption
Social anvironmental policy	Earmor accontance and utilization
social, environmental, policy	- Farmer acceptance and utilization Eavourable weather conditions
and market conditions	- Policies for yellow green gram production and utilization
necessary for development and	- Market information on volume. quality and supply
upscaling	consistency requirements
D: Economic, gender, vulnerab	le and marginalized groups (VMGs) considerations
Basic costs	The basic cost was estimated at KES 53,535/ha
Estimated returns	Total returns under improved management were estimated at
	KES 100,000/ha and a gross margin of KES 46,445/ha

Gender issues and concerns in	• Women and youth 's limited access to production
development, dissemination	resources such as land, knowledge, information, extension
adoption and scaling up	training, credit and quality seed.
	• Women may not have time and mobility to attend
	trainings and other extension activities far from home or
	held at times when they are performing other domestic
	roles
	• Women have limited access to markets as they sometimes
	cannot travel to far markets due to their domestic roles
	• Limited participation in decision making at the
	community and County level
	• Women do most of the green grams activities such as
	weeding and winnowing. Green gram farming therefore
	may initially increase their work burden unless there are
	This beau workload may limit groon grams adoption and
	scaling up for women farmers who may not afford to hire
	labour for weeding
	<ul> <li>Need for mechanization to ease drudgery at harvesting</li> </ul>
	<ul> <li>Women's double and triple roles means they may not</li> </ul>
	have time to participate in group activities
	• In some cultures women may not be able to travel away
	from their homes to meetings, without permission
	• Not recognizing women as farmers, therefore services and
	information are not tailored to address their priority
	enterprises
	• Women's time and mobility constraints mean that they
	may not be able to attend extension activities far from
	home or held at times when they have other roles
	<ul> <li>Lower average literacy rates limits women's use</li> </ul>
	extension material.
	<ul> <li>Limited access to improved seeds, fertilizer/ manure and</li> </ul>
	other inputs
Gender related opportunities	- The variety is high yielding therefore will lead to
	increased productivity that will benefit all the gender
	categories (men, women and the youth) in terms of
	providing employment The technology has high international and least demand
	- The technology has high international and local demand therefore offers an opportunity for map and the youth who
	are mostly involved in marketing especially in far markets
	therefore generating more income
	- As an early maturing and high yielding variety it will
	meet the food and nutrition security of all the gender
	categories in the household
VMG issues and concerns in	- Not recognizing VMG's as farmers, when designing
development dissemination	TIMPs such as the farm implements. Therefore, need to
adoption and scaling up	come up with tailor made implements that meets the
	VMG's needs and concerns
	- The VMGs have less access to resources such as land and
	credit

	- VMGs have less access to extension services due to
	prejudice and their social status
	- VMGs have Limited access to improved inputs such as
	seeds, fertilizer/ manure and other inputs
	- VMGs have less access to markets than the other gender
	categories
	- Strict rules of entry and requirements of producers'
	Due to their social status VMGs are often excluded from
	decision making in development and dissemination
	activities
	- VMGs have limited access to education, training and
	extension services than men
	- Due to prejudices associated with their social status, VMGs
	are excluded from access to and benefits from improved
	technologies
VMG related opportunities	- The technology can improve food and nutrition security
	and an opportunity for increased income
	- As an early maturing and high yielding variety it will
	meet the food and nutrition security of the VMGs in
	whole household.
	- It offers a good opportunity for income generation for the
	VMGs

### 2.2 Green Gram Seed System

2.2.1 TIMP Name	Green gram Own Seed Selection and Production
Category (i.e. technology,	Management Practice
innovation or management	
practice)	
A: Description of the techn	ology, innovation or management practice
Problem to be addressed	Green gram farmers grow green grams from grain harvested from the previous season. This method of recycling of seed leading to mixing and lower yields in subsequent growing seasons as well as loss of quality and originality of the variety.
What is it? (TIMP description)	Own seed selection is a process of identifying and carefully picking quality seed plants before harvesting of the entire crop. Since green gram is self- pollinated crop with a minimal cross pollination, farmers maintain their own variety through proper seed selection method. Own seed selection involves observation of health, true to type plants in the middle of the farm were pollen from other farms cannot reach. The selected plants are then harvested early and well dried. These plants are threshed and the seed stored in a dry, clean well ventilated place for planting next season. Own seed selection should only be practiced on one variety for a maximum of three seasons then the farmer should get certified seed.

Justification	Selection of high quality seeds is a prerequisite for achieving high greengram yields. Planting high quality seed ensures varieties are maintained in a relatively better genetic purity leading to farmers maintaining good seed for longer before they are required to acquire certified seed from seed dealers.
B: Assessment of dissemination	ation and scaling up/out approaches
Users of TIMP	Farmers, seed dealers, researchers, Extension service providers.
Approaches used in	On farm and on station research trials and demonstrations
Dissemination	Training workshops, seminars, meetings
	• Field days
	<ul> <li>MoA/Extension officers</li> </ul>
	• Farmer research networks
	• Farmer to farmer exchange
	<ul> <li>Mass media – Agricultural program</li> <li>Dremetional motorials (masters/knashungs/looflats, menusals)</li> </ul>
	• Promotional materials (posters/brochures/leanets, manuals) Web materials
	• Web materials
Critical/essential factors for	• Development of certified seed systems to backstop own seed selection
successful promotion	• Seed availability and accessibility through green gram research
	• Well organized farmer groups and networks
	<ul> <li>County and central government support</li> <li>Funding to research, validate and promote new green gram variaties and</li> </ul>
	seed production
Dontrong (stalsaholdong for	- KALDO National Agricultural Dessanah Institutes (NADIs) and
scaling up and their roles	• [KALRO, National Agricultural Research Institutes (NARIs) and International research organizations e.g. The International Food Policy Research Institute (IFPRI) for provision of appropriate variety seed and production information
	<ul> <li>Seed companies for quality seed multiplication</li> </ul>
	• Market players to create a demand and provide production incentives
	• Farmers/farmer groups to adopt and produce
	• County governments, central government e.g. Chiefs, Agricultural Extension (Formal and informal) for policy, awareness and dissemination
	NGOs to promote greengram
	• .Financial institutions e.g. Banks, donors and other credit facilitators for
	financial solutions
C: Current situation and f	uture scaling up
Counties where already	Tana River, Tharaka Nithi, Kwale, Machakos, West Pokot, Isiolo,
promoted if any	Makueni and Kitui
Counties where TIMP will be up scaled	Isiolo, Garrissa, Tana River, Tharaka Nithi, Kitui, Siaya, Makueni, Migori, Homabay,
Challenges in dissemination	<ul> <li>Poor seed distribution networks</li> <li>Inadequate knowledge on importance of using good quality seed</li> <li>Financial constraints</li> <li>Unwillingness of farmers to buy quality seed</li> </ul>

Social, environmental, policy and market conditions necessary for development and up scalingCreation of community awareness on nutritional qualities in food systems• Creation of community awareness on nutritional qualities in food systems• Raise awareness on the soil fertility improvement using greengrams (N- Fixation).• Harmonious gender and social consideration in research, consumption and marketing. • It is an already "a climate smart ready crop" due to its wide adaptation <b>D: Economic, gender, vulnerable and marginalized groups (VMGs) considerations</b> Basic costsKES 51,800Estimated returnsKES 39,350(Gross margins)Gender issues and concerns in development, dissemination, adoption and scaling up• Women have been having low yields due to poor quality of seeds as they have been using recycled seeds• Green gram production is labour intensive especially in planting, weeding, threshing which are mostly done by women and youth • Land is owned mainly by men who may have not have interest in green gram production • Financial empowerment, the poor farmers lack funds to acquire seed • Slow information and awareness flow to female farmers due to academic levels• The training materials and strategies are not favorable to women farmers• Markets /agro vets for clean seeds may not be available for women and their mobility is limited by their domestic rolesGender related Opportunities• There is potential for quality seeds for women improving the quality of crop yields for women • There is increased production of green grams leading to improved incomes for women and youth• There is creation of employment for women and youth	Suggestions for addressing the challenges Lessons learned in up scaling if any	<ul> <li>Research to develop high yielding superior varieties with quality seed</li> <li>Information dissemination on importance of using good seed to increase yield</li> <li>Train farmers on seed selection and facilitate their ability to access seed</li> <li>Involve county governments, extension, marketers and processors</li> <li>Creation of awareness through demonstrations and farmer workshops helps in adoption of technologies and innovations</li> <li>Availability of market is key</li> </ul>

Research Gaps1. Testing of a well-organized seed production, multiplication and delivery system

2.2.2. TIMP Name	Green gram informal seed system

Category (i.e. technology,	Management Practice
innovation or management	
practice)	
A: Description of the technol	ogy, innovation or management practice
Problem to be addressed	Green gram seed systems are not well established and this has hindered promotion of the crop to the target areas. Promotion of Green gram to farmers in the various counties requires enough seed to reach the targeted number of farmers. The weak Green gram formal seed system has not be able to achieve the quantities
What is it?(TIMP description)	It is a systematic multiplication of basic seed sourced from the formal seed sector into quality seed that more farmers in the community can access and improve their crop production. It involves community seed bulking which is a process of engaging selected individuals or farmer groups to multiply green gram seed under technical supervision following seed multiplication guidelines.
Justification	There is inadequate certified green gram seed to meet demand. Consequently, there need for informal seed system which will involve community seed bulking. Individual farmers or farmer groups are selected to multiply green gram seed under technical supervision of seed companies and KEPHIS. They follow the requisite seed production guidelines to reach more farmers with the available green gram varieties.
B: Assessment of dissemination	ion and scaling up/out approaches
Users of TIMP	Farmers, seed companies, seed merchants, researchers, Extension service.
Approaches used in Dissemination	<ul> <li>On farm trials and demonstrations</li> <li>Training workshops, seminars, meetings</li> <li>Field days</li> <li>MoA/Extension officers</li> <li>Farmer research networks</li> <li>Lead farmers and farmer groups</li> <li>Promotional materials (posters/brochures/leaflets, manuals)</li> <li>Web material's</li> </ul>
Critical/essential factors for successful promotion	<ul> <li>Development of robust seed systems to backstop community seed bulking</li> <li>Availability of early generation seed through research</li> <li>Well organized farmer groups and networks</li> <li>County and central government support</li> <li>Funding for research, validation and promotion of new green gram varieties and seed production</li> </ul>

2.2.3. TIMP Name	Green gram Formal seed system
Category (i.e. technology,	Management Practice
innovation or	
management practice)	
A: Description of the tech	hnology, innovation or management practice
Problem to be addressed	Low grain yields due to use of poor quality green gram seed
What isit?(TIMP description)	Formal seed system is the process of producing quality seed starting from release of varieties, production of early generation seed and certified seed up to the stage where the farmers can access it through seed merchants for planting. The main stakeholders in formal seed systems include breeders, seed companies and retailers among others.
Justification	The selection of quality and high yielding seeds is a prerequisite for improved green gram grain yield. The success of the green gram value chain in Kenya will require the establishment of a strong formal seed system and seed access channels for quality seed to reach the green gram farmers.
<b>B:</b> Assessment of dissemi	ination and scaling up/out approaches
Users of TIMP	Farmers, seed stockists, seed merchants, researchers, extension service.
Approaches used	On station research, on farm trials and demonstrations
in dissemination	Training workshops, seminars, meetings
	• Field days
	MoA/Extension officers
	• Farmer research networks
	Lead farmers and farmer groups
	<ul> <li>Promotional materials (posters/brochures/leaflets, manuals)</li> <li>Web material's</li> </ul>

Critical/essential factors for successful promotion	<ul> <li>Development of good seed systems to backstop community seed bulking and own seed selection</li> <li>Seed availability and accessibility through green gram research</li> <li>Well organized farmer groups and networks</li> <li>County and central government support</li> <li>Funding for research, validation and promotion of new Green gram varieties and seed production</li> </ul>
Partners/stakeholders	<ul> <li>KALRO, Breeders, National Agricultural Research Institutes and</li> <li>International research organizations e.g. The International Food Policy</li></ul>
for scaling up and	Research Institute (IFPRI) to provide varieties, seed and production
their roles	information <li>Seed companies for quality seed multiplication</li> <li>KEPHIS for quality control</li> <li>Market players to create a demand and market pull for production</li>

	<ul> <li>County governments, central governments e.g. Chiefs, Agricultural Extension (Formal and informal) for policy, awareness and dissemination</li> <li>NGOs to take up green gram promotion Catholic Relief services, for farmer organization and mobilization</li> <li>Financial institutions e.g. Banks, donors and other credit</li> </ul>
	facilitators for financial solutions
C: Current situation and futur	e scaling up
Counties where already promoted if any	Machakos, Makueni, Mbeere, Kajiado
Counties where TIMP will be up scaled	Tana River, Tharaka Nithi, Kitui, Makueni, Machakos,
Challenges in Dissemination	<ul> <li>High cost of inspection (transport, frequency of inspection)</li> <li>Inadequate knowledge on seed production practices</li> <li>Unwillingness of farmers to buy quality seed</li> <li>Low awareness of importance of green gram in most parts</li> </ul>
Suggestions for addressing the challenges	<ul> <li>Research to develop high yielding superior varieties with quality seed</li> <li>Information dissemination on importance of using good seed to increase yield</li> <li>Train farmers on certified seed production practices and empower their ability to access quality seed</li> <li>Develop good seed policy for the green gram crop</li> <li>Involve County governments, extension, marketers and</li> </ul>
Lessons learned in up scaling if any	<ul> <li>Creation of awareness through demonstrations and farmer workshops helps in adoption of technologies and innovations</li> <li>Availability of seed market to create demand</li> </ul>
Social, environmental, policy and market conditions necessary for development and up scaling	<ul> <li>Creation of awareness on nutritional benefits to human and livestock feed.</li> <li>The use of green gram as a catch crop</li> <li>Nitrogen fixing ability of green gram to improve soil quality</li> <li>Harmonious gender and social consideration in research, consumption and marketing.</li> <li>It is an already "a climate smart crop" due to its wide</li> </ul>
D: Economic, gender, vulneral	ble and marginalized groups (VMGs) considerations
Basic costs	KES 60,000/acre
Estimated returns	INED 40.000/ha under good management (Gross margins/acre)

Gender issues and concerns in development ,dissemination, adoption and scaling up	<ul> <li>Women have been having low yields due to poor quality of seeds as they have been using recycled seeds</li> <li>Green gram production is labour intensive especially in planting, weeding, threshing which are mostly done by women and youth</li> <li>Land is owned mainly by men who may have not have interest in green gram production</li> <li>Financial empowerment, the poor farmers lack funds to acquire seed</li> </ul>
	<ul> <li>Financial empowerment, the poor farmers lack funds to acquire seed</li> <li>Slow information and awareness flow of new seed varieties to female farmers due to academic levels</li> <li>The training materials and strategies are not favorable to women farmers</li> <li>Markets /agro vets for clean seeds may not be available for women and their mobility is limited by their domestic roles</li> <li>Men are not fully involved in the production of green</li> </ul>
Gender related Opportunities	<ul> <li>There will be increased production of green grams leading to improved food and nutritional security for women and entire household</li> <li>There will be increased employment for women and the youth</li> <li>Women will get appropriate information relating to</li> </ul>
VMG issues and concerns in development, dissemination, adoption and scaling up	<ul> <li>Dissemination methods and documents that are not always easy to understand or access</li> <li>VMGs have low access to seed sources due to their limited mobility</li> <li>VMGs have financial constraints so they are not able to purchasequality seeds</li> <li>Limited access to production resources such as land, knowledge, information, extension training, credit and quality seed.</li> <li>Some of the agronomic practices are not easy for VMGs to undertake since they are laborious</li> <li>VMGs may have limited access to finances to buy the required inputs such as quality seeds</li> <li>Due to their social status VMGs are often excluded from decision making in development and dissemination activities</li> <li>VMGs have limited access to education, training and extension services</li> </ul>

VMG related opportunities	<ul> <li>There will be increased production of green grams leading to improved food and nutritional security for VMGs</li> <li>There will be increased employment for VMGs</li> <li>There will be improved food security and nutrition for VMGs especially the sick</li> <li>The micro-nutrients in green gram are particularly healthy for persons with HIV/AIDS</li> <li>There will be quality seeds for VMGs to plant.</li> </ul>
E: Case studies/profiles of suc	cess stories
Success stories from previous similar projects	Green gram production has been very successful and economically important in Kitui county. It is now a major and priority crop in kitui county where it is grown as an export commodity

## **Research Gaps**

1. Certified seed production, multiplication and deliveryunder small holder systems

2.3.1 TIMPs name	Good Agr.icultural Practices (GAP)
Category (i.e. technology, innovation or management practice)	Management practice
A: Description of the technology	, innovation or management practice
Problem addressed	Loss of markets due to threat to environment, worker safety and health due to unverrifiability of application of standardized food safety measures taken along the Green gram value chain.
	cereals, including Green gram, has been rampant. This results in declining food safety and quality, therefore frustrating sustainable farming of these crops for both food and income generation. Most market continue to impose more stringent measures (to ensure safety of consumers) for those wishing to access the said markets. These contaminants also impact negatively on the environment, worker safety and health, and consequently making it difficult to implement traceability as most producers do not give accurate information on inputs and processes used during production, to avoid commercial losses and even prosecution
What is it? (TIMP description)	It is a systematic process of implementing a standardized production system globally designed to reassure consumers about how food is produced on the farm, pre-farm gate or on- farm standards. It is not about a specific crop production but the process through which production takes.
Justification	Loss of markets due to the rampant detection of food contaminants in Green grams threatens the production of the crop. Good Agricultural Practice (GAP) is based on the principals of risk prevention, risk analysis, sustainable agriculture by means of Integrated Pest Management (IPM) and Integrated Crop Management (ICM)] to continuously improve farming systems. GAP is of utmost importance in protecting consumer health by ensuring safety throughout the food chain. It needs to be enforced and transparent not only from the table but also upstream to include suppliers (e.g. quality of fertilizers and plant protection products) and all t h e value chain players including providers of logistics and farm equipment. The four 'pillars' of GAP (economic viability, environmental sustainability, social acceptability and food safety and quality) are included in most private and public sector standards, but the scope which they actually cover varies widely. Commercialization of Green grams on the domestic and export level highly depends on compliance to these market standards

# 2.3. Good Agricultural Practices and Food Safety Management System

B: Assessment of dissemination and scaling up/out approaches	
Users of TIMP	All value chain players including producers, extension staff, processors, transporters and market outlet operators such as wholesale and retail chains, domestic markets and farm gate handlers
Approaches to be used in dissemination Critical/essential factors for	FFBS On-farm experimentation field days, shows Training of trainers Publications Media Digital platforms Policy support from government particularly the enforcement
successful promotion	of KS1758 (a domestic scope standard that has been passed after undergoing public participation stage).
Partners/stakeholders for scaling up and their roles	<ul> <li>Producer organizations (FPEAK, FPC, KFC, AGAK etc)</li> <li>Mobilization of individual producers for training on GAP</li> <li>Expertise for training from institutional QMS (Quality Management Systems) and standards officers</li> <li>They hold franchises from Global GAP international</li> <li>Certifying bodies (eg BVQ, SGS, Africert, KenCert)</li> <li>Offering certification services to trained producers and prescribing corrective actions</li> <li>Training Partner</li> <li>MoALID, Council of Governors' and County Governments, AFA, KEPHIS, HCD</li> <li>Policy framework and operationalization of Commodity codes of conduct requiring GAP compliance and KS 1758</li> <li>Legal enforcement particularly from competent authorities</li> <li>NGO's, Private extension providers and other value chain players</li> </ul>
	<ul> <li>Mobilization and organization of producer groups and organizations</li> <li>Mobilization of farmers</li> </ul>
C: Current situation and future	Support for the training and support services scaling up
Counting where already meret 1	
if any	For other fresh produce crops, already promoted in Meru, Embu, Nyeri, Nyandarua, Muranaga, Embu, Kirinyaga, Kisii, Uasin gishu, Nakuru, Kericho, Bomet and other horticultural hot spots

Counties where TIMP will be up scaled	All counties in Kenya particularly where green grams is grown
Challenges in dissemination	<ul> <li>Inadequate funds to reach value chain actors</li> <li>New concept not very well known among the primary stakeholders and market outlets</li> <li>The perception that GAP is oppressive rather than supportive</li> </ul>
Recommendations for addressing the challenges	Continuous training of farmers, extension staff and other value chain players
Lessons learned in up scaling, if any	The low number of stakeholders aware of GAP
Social, environmental, policy and market conditions necessary for development and promotion	The GAPs will be acceptable to the target communities Supportive policy of national and county governments to promote adaption of GAP's.
D: Economic, gender, vulnerabl	e and marginalized groups (VMGs) considerations
Basic costs	Difficult to put monetary gains figures as most involves social and welfare issues in addition than markets lost due to non- compliance
Estimated returns	Benefits are mostly social welfare issues in addition to additional markets accessed
Gender issues and concerns in development, dissemination adoption and scaling up,	<ul> <li>Women and youth have less access to factors of production like land and credit</li> <li>In most households, it is the men who make decision on what to do and how it is done</li> <li>Women may not have time and mobility to attend trainings and other extension activities far from home or held at times when they are performing other domestic roles</li> <li>Women have limited access to markets as they sometimes cannot travel to far markets due to their domestic roles</li> <li>Women might not be aware of GAPs due to their low level of education and the social economic status</li> <li>There is need for all the stakeholders to be sensitized in GAPs to achieve good profits from their green grams products</li> </ul>
Gender related opportunities	<ul> <li>Agro-enterprise development by youth, females and males based on GAPs</li> <li>Increased income due to improved income as a result of using GAPs by the youth, females and males</li> </ul>
VMG issues and concerns in development, dissemination, adoption and scaling up	<ul> <li>VMGs have less access to GAPs as they are not given chances to participate in agricultural trainings and workshops</li> <li>VMGs have less access to farmer organizations</li> <li>VMGs have less access to farm implements VMGs have limited access credit to meet the cxtra cost of implementing the required GAPs</li> <li>VMGs have limited access to training on GAPs and extension services</li> <li>Due to their social status VMGs are often excluded from decision making in development and dissemination of GAPs</li> </ul>

	• There is low adoption by VMGs due lack of awareness
VMG related opportunities	<ul> <li>Agro-enterprise development by VMGs based on GAPs</li> <li>Increased income due to improved yield because of using GAPs, market access for the VMGs</li> <li>Employment opprtunities in GAP activities for VMGs and improved food security</li> </ul>
E: Case studies/profiles of succes	ss stories
Success stories from previous similar projects	This has not been done for Green grams. However, Small, holders in groups in the counties of Kirinyaga, Nyeri, Meru, Nakuru and other counties have been able to produce and export produce that is certified after adopting and complying with GAP's.

2.3.2 TIMP Name	Food Safety Management System: Hazard Analysis Critical Control Points (HACCP) Plan for Green Grams Chain in Kenya
Category (i.e. technology, Innovation or management practice)	Management Practice

A: Description of the technology, innovation or management practice		
Problem addressed	Loss of product market due to risk to human health through presence of chemical, biological and physical hazards within the Green gram value chain in Kenya.	
	have a direct effect on consumer's health. There is increasing demand for high quality of the crop and other products where it is incorporated, from consumers and public health departments in counties.	
	The biological contaminations previously reported on this value chain include presence of <i>Escherichia coli</i> (E. coli), <i>Salmonella</i> spp., <i>Aspergillus flavus</i> and <i>Aspergillus parasiticus</i> . The chemical hazards are mainly due to heavy metal presence such as lead/mercury/cadmium: while exceedance of MRLs been reported	
	These hazards are suspected to cause neurological disorders, cancer and birth defects.	
What is it? (TIMP description)	Food safety management system (FSMS) through Hazard Analysis and Critical Control Point (HACCP) in Green gram value chain is a system of food safety monitoring and control based on the systematic identification and assessment of various hazards. It is a preventive, rather than a reactive, tool that places the protection of the Green Gram supply from biological, chemical and physical hazards into the hands of food management systems. The system is designed to minimize the risk of food safety hazards by identifying the hazards, establishing controls and monitoring these controls.	
Justification	There is increasing demand for high quality of the crop and crop products, from consumers and public health departments in counties. Presence of contaminants in foods pose serious risks to human health and trade. The biological contaminations previously reported in green grams include presence of Escherichia coli (E. coli), Salmonella spp., Aspergillus flavus and Aspergillus parasiticus. Chemical hazards are mainly due to heavy metal presence such as lead/mercury/cadmium; while exceedance of MRLs been reported. These hazards are suspected to cause neurological disorders, cancer and birth defects. There is need to put in place risk analysis and hazard monitoring and management system to ensure that food contaminants are kept at bay along the Green gram value chain. Such tools are used globally and even adapted by Codex Alimentarius as a global acceptable FSMS. This will set limitation values for monitoring so that action can be taken if the set point values of hazards are out of the defined range as required. Parameters will be quantified for production, harvesting, processing, distribution and value addition	
B: Assessment of dissemination a	nd scaling up/out approaches	
Users of TIMP	Green gram value chain actors from farmers, traders, food vendors and consumers.	
Approaches used in dissemination	FFBS On-farm experimentation Field days, shows	

	Training of trainers
	Publications
	Media
	Digital platforms
Critical/essential factors for	• Formation of "experts" team composed of HACCP specialists,
successful promotion	food scientists, microbiologists, representative of the Green
	gram (and other similar crops) value chain players, public
	health officers, and a quality control and safety specialists
	from the competent authorities to guide the process
	Local and National governments support
Partners/stakeholders for scaling	KALRO, National Agricultural Research Institutes
up and their respective roles.	(NARIs) and International research organizations:
	Support with research on Food safety Matters
	• Market players, Farmers/farmer groups: Recipients of
	training and implementers within the value chain
	• County governments, central governments e.g. Chiefs,
	Agricultural Extension (Formal and informal) for
	policy, awareness and dissemination, National
	competent authorities: Policy development,
	enforcement, mobilization and dissemination
	• NGOs/private companies/other public service providers:
	Farmer organizing and mobilization and support e.g.
	SACDEP
	• Analytical testing services by public/private laboratories
	Processors and local traders
C: Current situation and future	scaling up
Counties where already promoted	• Not promoted in any county of Kenya
if any	
Counties where TIMPs will be up	• All counties growing and consuming Green gram in
scaled	Kenya.
Challenges in development	• Inadequate funds to reach value chain actors
and	• New concept not very well known among the primary
dissemination	stakeholders and market outlets
Suggestions for addressing the	Funding of dissemination platforms
Challenges	• Training of all stakeholders on food safety
Lessons learned in up scaling, if	• None since scaling up has not been done
any	
Social, environmental, policy	• The practice will be acceptable to target communities
and market conditions	• The market will accept and recompense the certified
necessary for	produce
development and up-scaling	• The policy environment will be supportive of the practice,
	requirements of the system and apprppriate pricing
D: Economic, gender, vulnerable	e and marginalized groups (VMGs) considerations
Basic costs	To be determined
Estimated returns	To be determined
Gender issues and concerns in	• Women and youth might not be aware of the existing
development. dissemination	hazards, their preventive measures and control
adoption and scaling up	• Women and youth might not be aware of the impact
Paron and Sound up	1 monten and youth might not be aware of the impact

	identified hazards could have to their health
	• In harvesting and processing green grams to meet the
	acceptable national standards, women and youth play critical
	roles.
	• Therefore, there is need to build the capacity of women and
	youth in the identifications of food safety hazards/risks and
	the control measures along green grams value chain
	• Women and youth lack finances to implement the sytem
Gender related opportunities	Opportunities exist for women and youth in employment in the
	activities of the system.
VMG issues and concerns in	• VMGs have limited access to production resources such as
development, dissemination,	land, knowledge, information, extension training, and credit
adoption and scaling up	and quality seed.
	• VMGs have limited participation in decision making at
	community and County level
	• Require strategies that target the VMG during scaling up of
	the green grams value chain.
VMG related opportunities	Opportunities exist for VMGs in employment in the
	activities of the system
	• Healthy produce for he household to he benefit of the
	VMGs

# 2.4. Agronomy

2.4.1 TIMP name	Plant spacing		
Category (i.e. technology,	Management practice		
innovation or management			
practice)			
A: Description of the technology	y, innovation or management practice		
Problem addressed	Low productivity due to due to belo or above optimal crop		
	spacing (leading to low or high plant population per unit area).		
What is it? (TIMP description)	Plant spacing is the distance within and between rows at which		
	seeds are planted. Green gram is planted at the soacing of 0.4.		
	m x 0.15m One plant is maintained plant per station Over		
	seeding reduces yield lowers quality of grains because of		
	competition for light and nutrients.		
	ASCO ASCO		
	A farmer seeding medium maturity (105 – 150 days) green gram variety at 0.45m by 0.15m		
Instification	Low groop grom groin yield is ottributed to poor good rote emong		
JUSTIFICATION	other crop husbandry problems. The most common method of		

	planting is dibbling, which is sowing in lines/rows of known			
	spacing. However, some farmers also plant by broadcasting and			
	drilling the seeds which are not gapped (in case of poor			
	emergence) or never thinned (in case of high population). Use of			
	recommended spacing is advantageous as it requires less seed			
	ensures ontimum plant population high yield and quality			
	grain/seed

2.4.2 TIMP name	No-till (zero) tillage				
Category (i.e.	Management practice				
technology, innovation					
or management					
practice)					
A: Description of the te	chnology, innovation or management practice				
Problem addressed:	Decreased crop yields due to soil erosion.				
description)					
description)	For the provided solution of the field. In case of weeds at sowing time, they are eradicated using non-selective post-emergence herbicides. For weeds occurring after after the crop has emerged, weed				
	are controlled using selective post-emergence herbicides. Alternatively the weeding may be achieved through up-rooting weeds or slashing weed at ground level without soil disturbance. Over 75% of residues is left on the soil surface after the crop harvest.				
Justification	<ul> <li>Land degradation characerised by declining soil fertility (physical, chemical and health) is a common scenario witnessed by farmers in semi-arid ecologies. The situation leads to low land productivity, crop yields, and whole farm sustainability. At farm level, land degradation is mainly attributed to continuous land operations (ploughing, seeding and weeding) using conventional tools. The approach leads to increased soil erosion, loss of soil carbon and greenhouse gases (GHGs) in the environment. As a conservation agriculture practice, the zero tillage (no-till) has potential to:</li> <li>Enhance soil fertility and organic matter, and improvement of the efficiency of nutrient inputs, helping to produce more with</li> </ul>				
	<ul> <li>proportionally less fertilizer.</li> <li>Reduce GHG emissions from thr soil.</li> <li>Minimize the net losses of carbon dioxide by microbial respiration and oxidation of the soil organic matter and build soil structure and bio-pores through soil biota and roots</li> </ul>				

	• Protect the soil surface from direct sun rays and rain drops, winds			
	<ul> <li>Reduce soil compaction caused by ploughing implements(s)</li> </ul>			
	• Reduce son compaction caused by prougning implements(s)

dissemination	clear land rights)			
	• Inadeequate trained personell on CA			
	Inadequate fund for dissemination activities			
Suggestions for	Enhance Public Private Partnerships (PPP) to support increased			
addressing the	adoption			
challenges	• Improve KALRO and county government capacity to train and re-tool			
	technical team so as to enhance uptake of the technology			
• Allocate more funds for continued research and dissemination of the				
T				
Lessons learned in	• Uptake of CA technology increases with the realized incremental			
scaling if any	benefits over time			

	Continuous capacity building increases CA technology uptake				
Social,	• The practice will be appropriate for and acceptable by target				
environmental,	communities				
policy and market	• The environment will be suitable and appropriate for implementation of				
conditions	the TIMP				
necessary for	• Reliable technology adoption and suitable price and market access for				
development and	produce under CA				
dissemination	• County policies that support households investing in CA with inputs				
	like implements				
D: Economic, gende	nder, vulnerable and marginalized groups (VMGs) considerations				
Basic costs	• Costs related to ripping services and herbicides amount to KES 6000				
	per acre.				
Estimated returns	• Reduction of costs associated with tillage-induced soil erosion and				
	degradation i.e. 60% of land degradation				
	• Returns on conserving soil exceeding 150 ton/hectare annually and				
	associated increased productivity				
Gender issues and	• Woment may not have access to training and sensitisation for a due to				
concerns in	rolse in the household				
development,	• Reduces labour demands across all gender, hence good for all gender				
dissemination,					
adoption and					
scaling up

opportunities	generating activities				
E: Case studies/pro	files of success stories				
Success stories	• Wide adoption of the CA principles and practices in Laikipia County,				
from previous	- large and small-scale farmers are using CA in growing different				
similar projects	crops.				
	• For approximately 8 year (2010 – 2018), the CA principles were				
	tested, promoted and adopted in some villages of Bungoma, Siaya,				
	Embu and Tharaka-Nithi Counties. This was achieved under ACIAR				
	financial support.				
Application	When implementing the 3 principles of CA, one needs to note the				
guidelines for users	following:				
	• I imely operations - preparing the land in good time before the rains				
	start; planting soon after an effective rainfall event; weeding at				
	appropriate times and intervals; doing effective pest and disease				
	Dragica anantiona Dragica maggines at a form on 1 alast maggine				
	• Precise operations - Precise measurements of row and plant spacing,				
	evenness of depth and placement of soil amendments and covering of				

	seed are also important. Planting should be done on the same lines each season				
	• Inputs (equipment, seeds, herbicides, manures/fertilizers), use the right				
	inputs, time and source.				
	• Livestock - try to keep livestock out of the fields, even after harvesting				
	the crop.

2.4.3 TIMP name	<b>Conventional tillage</b>		
Category (i.e. technology, innovation or management	Management practice		NE
practice)	Panga	lembe	Folk jembe
	Manual 1	and preparation or w	eeding tools
	Conventional land preparation methods (tractor ploughing-left picture,		
-------------------------------	----------------------------------------------------------------------------		
	oxen-ploughing-centre picture) and manual digging-left picture)		
A: Description of the	technology, innovation or management practice		
Problem to be	Low land productivity due to weed competition with a crop and poor		
addressed:	distribution of soil nutrients within the crop rooting zone.		
What is it? (TIMP	Conventional tillage is a land preparation system using cultivation as the		
description)	major means of seedbed preparation and weed control. Typically includes		
	a sequence of soil tillage (ploughing and harrowing) to provide a fine		
	seedbed for seeding. The system also removes most of the plant residue		
	from the previous crop. Later on after the crop has emerged, weed control		
	is done using conventional tools that digs out weeds which are removed		
	from the farmland. Over 75% of residues is removed from the farm land		
	after the crop harvest. Conventional ploughing is normally done either		
	using oxen or tractor pulled ploughs. The operation can also be done		
	manually using hand tools (jembes, folk jembes and pangas).		
Justification	Weed competition with a crop and poor distribution of soil nutrients		
	with the crop rooting zone is one of challenges faced by green gram		
	farmers. This results in reduced land productivity. Conventional land		
	preparation enables to overcome the problem by turning over the upper		
	layer of the soil, bringing fresh nutrients to the surface and burying		
	weed seeds deep in the soil surface. Higher percentage of planted seeds		
	is expected to germinate and emerge from such soil resulting in higher		
	productivity. Convention tillage involve ploughing, harrowing and		
	using heavy tools to dig out weeds from the farmland.		
	Since tillage disturbs the soil, the process may disrupt soil structure		
	accelerating surface runoff and soil erosion. Splashed particles clog		
	soil pores effectively sealing off the soil's surface resulting		
	in poor water infiltration. Therefore, conventional tillage needs to be		
	combined with management measures that prevent soil erosion and		
	surface crusting		
<b>B</b> • Assessment of diss	emination and scaling un/out annroaches

	demonstrations and exploratory trials
C: Current situation	and future scaling up
Counties where	Most counties in the medium to high rainfall areas & Arid and semi-
already promoted if	arid areas
any	
Counties where	Machakos, Isiolo, Taita Taveta, Tharaka Nithi, West Pokot, Baringo and
TIMP will be scaled	Tana River
Challenges in	• Limited labour for carrying conventional land preparation operations
dissemination	• Limited funds to fund land preparation (ploughing and harrowing)
	and weeding
	• Limited knowledge on the merit and demerit of conventional tillage
	systems
	• Limited access to land preparation implements
Suggestions for	• Enhance Public Private Partnerships (PPP) to support increased
addressing the	adoption
challenges	• Improve KALRO and county government capacity to train and re-
	tool technical team so as to enhance uptake of beneficial parts of the
	technology.
	• Allocate more funds for further research and dissemination of the
	TIMP
Lessons learned in	• Uptake of conventional land preparation has gone on for years, thus,
scaling if any	is taken by majority of farmers
	• Continuous capacity building on key benefits of the TIMP and on any
	other appropriate tillage/weeding method(s).
Social,	• Suitability of the TIMP to the agro-climatic and socio-economic
environmental, policy	condition of the farmer
and market	• Reliable technology adoption and suitable price and market access
conditions necessary	for farm produce.
for development and	• County policies that support households investing in farming to give
dissemination	supports where necessary.
D. Economic gender	vulnerable and marginalized groups (VMGs) considerations

Basic costs	• Costs related to conventional land preparation and weeding amount to KES 15,000 per acre. This is apart from the normal inputs of seed and fertilizer when establishing. But the costs do not reduce over the years.
Estimated returns	• Embarking on the TIMP the farmer may be able to gain up to 20% of the total cost of investment.
Gender issues and concerns in development, dissemination, adoption and scaling up	• If well taken and right tools availed, the TIMP is easily adopted by men, women, youth and vulnerable individuals in the community.
Gender related opportunities	Being a known and widespread technology, conventional tillage renders itself to easy adoption by all in the households. It will even be more appreciated by women, aged and vulnerable members of the community if gender suitable tools are availed through credits, insurances or subsidies.
VMG issues and concerns in	• Limited decision making on land use may limit the adoption of the TIMP by VMGs.
development, dissemination, adoption and scaling up	• Limited access to conventional tillage inputs such as farming tools, seed and pesticides may limit the TIMP adoption by VMGs.
VMG related opportunities	• Opportunity to for farming "soft loans", insurances and subsidies increased resilience.
E: Case studies/profil	es of success stories
Success stories from previous similar projects	• The conventional tillage TIMP includes some of the key farming practices that for many years have been promoted and adopted by farmers and other stakeholders in agricultural industry.
Application guidelines for users	<ul> <li>When implementing conventional tillage systems, one needs to note the following:</li> <li>Timely operations - preparing the land in good time before the rains start; planting soon after an effective rainfall event; weeding at appropriate times and intervals; doing effective pest and disease control before either spread too widely.</li> <li>Precise operations - Precise measurements of row and plant spacing, evenness of depth and placement of soil amendments and covering of seed are also important.</li> <li>Inputs (equipment, seeds, manures/fertilizers), use the right inputs, time and source.</li> </ul>

GAPS

Require further validation by researchers and university students to confirm what may not be clear or on basis of emerging issues e.g. mechanization.

There may be cases for further research because of emerging issues

<b>2.4.4</b> TIMP name	Intercropping (also Soil and water conservation technology)
Category (i.e. technology, innovation or management practice)	Management Practice
A: Description of the	technology, innovation or management practice
Problems addressed:	<ul> <li>Low crop yields, hence low farm returns</li> <li>Declining soil fertility</li> <li>Soil erosion problems</li> <li>Weeds infestation – managed using increased soil cover</li> <li>Vulnerability to crop pests - practice helps slow the proliferation of pests and protect yields</li> </ul>
What is it? (TIMP description)	<ul> <li>Intercropping is a farming method that involves planting or growing more than one crop at the same time and on the same piece of land. The practice offers a potential to increase yields, enhance soil fertility and minimize the effects of climate change.</li> <li>There are two methods of intercropping: <ul> <li>i. Moja-moja intercropping method: One green gram row is alternated with that of a cereal (maize), thus referred to as 'moja moja' intercropping system. The spacing for either crop is maintained at 75 cm between rows.</li> </ul> </li> <li>ii. Mbili Intercropping method. Two green gram rows are alternated with the space of the system. The space of the system of the system of the system of the system.</li> </ul>
	with two cereal (maize) rows, thus referred to as 'mbili
	intercropping system. The spacing between the two main maize rows is 1.0m, then two green gram rows are equal distance planted

	in-between maize rows (i.e. within the 1.0m space)
	0.5m 10m 0.33m 0.34m 0.33m Maize plants Pigeon pea plants
Justification	Climate change is negatively impacting on agricultural production. Farmers are experiencing low yields, crop failures, declined soil fertility and generally low farm returns from their investments. As a semi-arid suited crop, green gram is intercropped with cereal crops such as maize, millet and sorghum. Intercropping is one of the potential management practice of enhancing climate change adaptation. It offers the potential to increase yield, enhance soil fertility and environmental biodiversity. The practice is known to build healthy soils, control pests and harness a variety of benefits to increase yields. The practice encourages biodiversity by providing a habitat for a variety of insects and soil microbes that would not be present in a single-crop environment (sole cropping system). Intercropping has several advantages. First, an intercrop may use resources of light, water, and nutrients more efficiently than single crops planted in separate areas, and this can improve yields and income. Secondly, crop mixtures frequently have lower pest densities, especially of insect pests. This occurs both because the mixture confuses the insects and, if chosen carefully attracts beneficial predators. Finally, intercropping allows for more effective management of cover crops. The practice works very well in regions where land for cultivation is limited.
	<i>Mbili</i> intercropping methods (see illustrations above)
B: Assessment of diss	semination and scaling up/out approaches
Users of TIMP Approaches to be used in dissemination	Farmers and wide range of users in the rural and urban areas On-farm and on-station demonstrations, agricultural shows, students and extension service providers
Critical/essential factors for successful promotion	<ul> <li>Awareness creation on the benefits and contribution of the practice to all stakeholders.</li> <li>Easy access of crop varieties that are compatible with the intercropping systems.</li> <li>Technical packages describing appropriate schedules of planting intercrops.</li> <li>Package on fertilizer rates and regimes under the practice.</li> </ul>
Partners/stakeholders for scaling and their roles	<ul> <li>County governments – to provide extension services, farmer mobilization and policy formulation</li> <li>NGOs – to provide support on capacity building and micro-financing services</li> <li>Universities- lecturers and students validating for other</li> </ul>

	arrangements
	• Farmer platforms (e.g. AIPs and FFBS) – provide land, security for
	demonstrations and exploratory trials
<b>C:</b> Current situation	and future scaling up
Counties where	Most counties in the medium to high rainfall areas & Arid and semi-arid
already promoted	areas
Current extent of	Although farmers in these counties practice intercropping, most fall
reach	short of using the right seed and other agronomic practices, hence do not
	fully benefit from the undertaking.
Counties where	Machakos, Isiolo, Taita Taveta, Tharaka Nithi, West Pokot, Baringo and
TIMP will be scaled	Tana River
Challenges in	• Limited access and wide distribution of clean planting materials
dissemination	(crop species, varieties feasible for intercropping systems)
	• Inadequate access of technical materials on the establishment,
	operations and management of intercrop management practice by
	farmers
	• The increased effects of climate change hindering adoption.
	• Farmer high poverty levels coupled with illiteracy especially in deep
	rural areas of Kenya.
Suggestions for	• Enhance access of clean planting materials across the counties, -
addressing the	work closely with certified seed merchants, research institutions
challenges	• Train and sensitize farmers on the basic principles of intercropping,
	their benefits and types suitable to their contexts. Use farmer field
	schools, AIPs and FFBS for demonstrations and wider scaling.
	• Develop a comprehensive manual on the intercropping practices to
	guide the farmers during the adoption and implementation processes.
Lessons learned in	• The practice is important as a biological pest management. This is where
up-scaling, if any	farmers can use trap crops to attract pests or keep them away from the
	other crop. Therefore, farmers can easily adopt this method to
	significantly cut down on pesticides input costs
	• The number of ecological benefits provided by this practice can also
	accelerate scaling to the other regions. Intercropping promotes
	interactions between crops and pollinators, thus supporting biodiversity,
	beneficial pests, and wildlife species.
	• Intercropping offers diverse source of nutrition, including minerals. This
	is due presence of more than one crop species in the farming system.
Social,	• Socially accepted by both male and female gender categories.
environmental,	• The practice is environmentally friendly as it enhances soil nutrients
policy and market	and biodiversity.
conditions necessary	• The system controls erosion and minimizes use of pesticides
D: Economic, gender	, vulnerable and marginalized groups (VMGs) considerations
Basic costs	This is a low cost management practice though technically demanding
	especially where the objective is to control pest through intercropping
Estimated returns	Dependent on the value chain crops in the intercrop case.
Gender issues and	• The practice integrates participation of both male and female gender
concerns in	roles during field implementation
development,	• The management practice is labour intensive, and may place a
dissemination	higher demand on women labour compared to men.

	• It is important to know the demands of the technology product end
	users for ease of acceptability
	• Gender disparities in access to information may impact on adoption
	decisions. Access to information is a pre-requisite for informed
	decisions on adoption.
Gender related	• Intercropping offers good opportunities to both men and women to
opportunities	grow diverse crops for economic gains, nutrition and at the same time
	offers enhanced biodiversity benefits.
VMG issues and	Low access to knowledge, technology and innovation information
concerns in	Less access to education and training
development,	Some are physically challenged and may not implement the practice
dissemination,	efficiently
adoption and scaling	Less access to productive resources e.g. quality seed credit, and land
up	Labour burden increase for the VMGs
VMG related	Intercropping places emphasis on the importance of using available land
opportunities	space to grow a diverse of food, increase biodiversity, pest management
	thus the practice is economically viable. The practice can therefore
	increase food security for the VMGs.
E: Case studies/profi	les of success stories
Success stories	Farmers have reported improved soil conditions, reduced runoff and
	buildup of nutrient loss, soil moisture retention in the soil and generally
	an increased crop production following application the practice.
Application	• Intercropping scheme is aimed at improving the overall economics
guidelines for users	of the farm. It is for this reason any new intercropping idea should
	first be tested on a relatively small area for evaluations
	• Observe careful timing of field operations (sometimes necessitating
	special interventions) to keep competition between the intercropped
	species in balance
	• A crop mix that works well in one year may fail the next if weather
	favors one crop over another.
	• A mixture of crops with different growth forms or timing of
	development may make cultivation and use of mulches more
	difficult and less effective
	• Planting crops in alternate rows or strips greatly simplifies
	management and captures some of the benefits of intercropping for
	pest control
	<ul> <li>Intercropping poses a special problem for crop rotation. This is</li> </ul>
	because if plants from two families are mixed in the same bed or
	field achieving a substantial time lag before replanting either of
	those families may be difficult
	<ul> <li>Intercropping requires extra care and effort in planning and</li> </ul>
	maintaining a viable crop rotation

# 2.5. Integrated Soil and Water Management

2.5.1 Technology	Manure Management
name	
Category (i.e. technology, innovation or management practice)	Complementary technology
A: Description of the te	chnology innovation or management practice
Problem addressed	Land degradation characterized by the declining soil fertility, low yields, increased soil moisture stress, increased soil erosion and poor soil health Poor manure management and handling leading to increased GHG emissions and low quality manure
What is it? (TIMP	Manure Management is the optimal, site-specific handling of
description)	livestock manure from collection, through treatment and storage up to application to crops (and aquaculture).
Justification	The decline in soil fertility in smallholder system is a major factor inhibiting agricultural development on farms. It is estimated that soils are being depleted at annual rate of 22 kg/ha for nitrogen, 2.5kg/ha for phosphorous, and 15 kg/ha for potassium. Manure plays an essential role in the nutrient cycle where crops grow on land to feed livestock, which in return feeds the land with their manure. Recycling the (macro and micro) nutrients in manure reduces the need for additional fertilizer purchase. In general, adding manure to soils enhances soil fertility and soil health that leads to increased agricultural productivity, improved soil structure and biodiversity. Given the acute poverty and limited access to mineral fertilizers, manure has the potential of providing the limiting nutrients and improving the soil health.
B: Assessment of dissemination and scaling up/out approaches	
Users of TIMP	Farmers
Approaches used in	Open and field days
dissemination	Exchange visits
	Demonstration farms

Critical/essential factors	• Training on feeding, management and use of manure
for successful	• Dissemination approach used to reach target farmers
promotion	Model demonstration plots using cereal crops
Partners/stakeholders	County governments, Provide extension services, farmer mobilization
for scaling up and their	and policy formulation
roles	ILRI, technical backstopping
	NGOs – micro financing services
C: Current situation an	d future scaling up
promoted if any	Tharaka Nithi, Kajiado, Uasin Gishu
Current extent of reach	Though small scale farmers in the counties apply manures and composts on their farms, they do not optimize on usage.
Counties where TIMP	Machakos, Bomet, Kericho, Laikipia, West Pokot, Taita Taveta,
will be promoted	Nyandarua, Lamu, Tana river, Baringo, Marsabit, Garissa, Siaya, Kisumu
Challenges in	- Lack of model demonstration farms
dissemination	- Cultural challenges -Lack of interest by pastoral communities
	- Lack of continuity in training of extension and farmers in the skill
	for manure management
	- Lack of proper moonization mechanism for reaching many farmers
Suggestions for	• Establishment of many demonstration plot by counties
addressing the	<ul> <li>Capacity building of pastoral communities on manure</li> </ul>
challenges	management and its benefit
	• Continuous capacity building of demonstration farmers and
	extension workers
	• Use of approaches to mobilize farmer to attend demonstration forums
Lessons learned if any	<ul> <li>Proper use of manures improves soil fertility</li> </ul>
	- Use of manures enhances crop productivity
	- Skills in manure preparation, storage and application
Social, environmental,	Applying manure to soils saves on purchase of inorganic fertilizer,
policy and market	increases crop yield and saves water.
conditions necessary	
	Propagation of invasive species when the seed is ingested by the
	Aminal and passed to crop field Manure can harbor pathogens which can cause disease outbreaks to
	livestock
	Contamination of water sources by leaching of nutrients
	Organic manures when poorly handled increase GHG emissions.
	However, IMM provides practices that are able to minimize GHG
	emissions.
D: Economic. gender. v	ulnerable and marginalized groups (VMGs) considerations
Basic costs	Proper handling of manure needs labour for collecting the manure.
	building a compost heap, maintaining it and finally transporting and
	applying it field which take a lot of effort and time

	Using locally available manure/composts saves on purchase of
	inorganic fertilizer.
Estimated returns	Returns on green gram value chain is high because of the low nutrient
	status of soils in the growing areas.
Gender issues and	It is labour intensive in terms of handling and application (often by
concerns in	broadcasting) hence may disadvantage women
development,	
dissemination, adoption	
and scaling up	
Gender related	Manure is locally available for farm households with keep livestock,
opportunities	hence opportunities available for both men and women.
VMG issues and	It is labour intensive in terms of handling and application hence may
concerns in	disadvantage VMGs.
development,	The VMGs are also resource poor, hence may not have access
dissemination, adoption	adequate manures, e.g. need many livestock
and scaling up	
VMG related	Manure is locally available for those farm households with livestock
opportunities	and can build on what they already own
E: Case studies/profiles	of success stories
Success stories	Farmers who adopt manure management practice have reported
	improved soil health and increased crop yield, and sustainable
	source of income
Application guidelines	The guideline focus on the following areas: -
for users	Animal feeds
	Livestock housing and manure collection
	Manure storage to preserve nutrient and avoid loses
	Manure treatment for ease of transport and application in the field
	Timing of application for maximum utilization by the crop
	Anaerobic digestion for biogas production
	Regular analysis of manure to ascertain the quality
	Manure/Composts take a long time to cure hence need good planning
	prior to use
F. Status of TIMP	Requires validation
readiness	Requires vandation
(1=Ready for	
unscaling: 2=Requires	
validation: 3-Requires	
further research

 Research gaps

 1.
 Promote manure management complementary technology in counties that have not practiced it.

2. Conduct nutrient budget study on selected farms utilizing manures (including composts).

2.5.3 TIMP name	Integrated Nutrient Management (INM)
Category (i.e.	Complementary technology
technology, innovation	
practice)	
A: Description of the te	chnology, innovation or management practice
Problem addressed	Low soil organic matter, declining soil fertility and conserving the
	limited available moisture in crop production.
what is it? (TIMP description)	Integrated Nutrient Management refers to the maintenance of soil fertility and of plant nutrient supply at an optimum level for sustaining the desired productivity through optimization of the benefits from all possible sources of organic, inorganic and biological components in an integrated manner
	+ + Inorganic fertilizers + Organic manures +
	+ +
	Bio-fertilizers Green manures
	Integrated nutrient management places emphasis on soil fertility status and special management needs, if any, local availability of nutrients resources (organic, inorganic and biological sources), economic conditions of farmers and profitability of proposed INM option. It emphasizes on the importance of using available organic fertilizers and micro-dosing with inorganic rates. This reduces costs from purchase of inorganic fertilizers, improves soil organic matter, fertility, texture and
	environment by ensuring nutrient recycling in the farms.

Justification	Soils within the farming system are low in organic carbon, fertility and
	moisture contents.
	Most of the farming systems in KCSAP target project counties are
	integrated cropping livestock systems. Crop residues are often used for
	livestock feed and bedding as farmyard manure (FYM) from livestock
	wastes are used in crop and pasture production. Other than the
	characteristic slow release of nutrients, the FYM produced is low
	nutrient quality due to poor management. Incorporating application of
	FYM with low or half doses of recommended inorganic fertilizers
	ensures quick availability of nutrients for crop growth and a long time
	improvement of soil conditions from effects of manure.
B: Assessment of disser	nination and scaling up/out approaches
Users of TIMP	Farmers
Approaches to be used	Training in workshops
in dissemination	On-farm visits
	Farmer field schools (FFS)
	On-farm demonstrations (during FFS)
Critical/assential	Availability of affordable and quality manure and increasi a fortilizars
factors for successful	- Take into account variability between farms in terms of farming goals
nromotion	and objectives size labour availability ownership of livestock
promotion	importance of off-farm income: and
	- Take into account amount of production resources (i.e. land money
	labour, crop residues) that different farming families are able to invest
	in.
Partners/stakeholders	County government extension services; Provide link with farmers.
for scaling up and their	Community farmer groups; play coordination role for ease in problem
roles	identification and dissemination.
C: Current situation an	nd future scaling up
Counties where already	Machakos, Busia, Siaya, Kisumu, Kakamega, Tharaka Nithi, Isiolo,

2.5.4 TIMP name	Integrated Soil Fertility Management (ISFM)
Category (i.e.	Complementary technology
technology, innovation	
or management	
practice)	

A: Description of the technology, innovation or management practice		
Problem addressed	Declining soil fertility, low organic matter, restoring soil structure and	
	conserving the limited available moisture in crop production.	
What is it? (TIMP	A set of soil fertility management practices that include the use of	
description)	fertilizers, locally available organic inputs and improved seed	
	combined to adapt practices to local conditions.	
	The ISFM places emphasis on the importance of using often scarce	
	resources like fertilizer and organic inputs efficiently through	
	techniques such as fertilizer banding (field application of fertilizer	
	directly in area of root-zone to increase the potential for uptake) and	
	micro dosing (applying small quantities of fertilizer with the seed at	
	planting time and a few weeks after emergence)	
Justification	Soils within the farming system are heterogeneous due to spatial	
	variability in soil fertility. These inherent differences arise from the	
	parent material from which the soil has evolved, and the position in the	
	landscape that influences how soil develops.	
	A large proportion of soils in the KCSAP target project counties are	
	derived from some of the oldest land surfaces which, due to weathering	
	and cropping, have low nutrients. Where younger, volcanic soils occur	
	these are inherently richer in nutrients, but may have other soil fertility	
	problems such as fixation of some critical nutrients such as phosphorus.	
	Past management of the soils also has a major influence on soil fertility	
	which in turn influences productivity	
	which in turn influences productivity.	
	These challenges call for an integrated soil fertility management	
	(ISFM) approach that combines appropriate interventions on soil	
	management that include fertilizer use and crop agronomy. The aim of	
	ISFM is therefore to optimize agronomic use efficiency of the applied	
	nutrients for improved crop productivity.	
B: Assessment of disser	nination and scaling up/out approaches	
Users of TIMP	Farmers Training in growthat and	
Approaches to be used	Training in workshops	
in dissemination	On-farm visits	
	Parmer field schools (FFS)

## **Research Gaps**

- 1. Validation of the ISFM technology in Counties where technology has not been tested.
- 2. Testing (fertilizer types, rates, frequencies) with different value chains

2.5.4 TIMP name	Rapid soil testing services
Category (i.e. technology,	Innovation
innovation or management	
practice)	
A: Description of the technolog	y, innovation or management practice
Problem addressed	<ul> <li>Conventional methods for soil testing are not cheap to farmers, results take long and not reproducible.</li> <li>Further, conventional methods have not provided solutions for paired soil and leaf testing to determine health of soil and crop simultaneously.</li> <li>Current methods do not provide a framework for large scale assessment of geo-referenced sampled points using standardized protocols.</li> <li>Limited access to soil testing services (centralized soil testing laboratories and cost).</li> </ul>
What is it? (TIMP description)	<ul> <li>This is a dry method for soil testing using simplicity of light—the interaction of electromagnetic radiation with matter to characterize biochemical composition of a soil and/or plant tissue.</li> <li>Requires partners involved (ICRAF, iSDA and SoilCares) to work closely with KALRO and county agricultural officers to sensitize farmers to embrace the testing method.</li> </ul>

	• This innovation will involve working closely with
	agronomists to generate specific fertilizer recommendation
	driven by soil and crop data obtained.
Justification	Soil testing is the basis for good fertilizer management that
	maintains the productivity of soil and improves the quality of
	crops. It promotes more efficient fertilizer use and prevents
	environmental pollution from excess fertilizer application, and
	cost efficiency. However, limited access to soil testing services
	is depriving the farmers' ability to make informed decisions
	with regard to soil management and fertilizer use.
<b>B:</b> Assessment of dissemination	and scaling up/out approaches
Users of TIMP	Farmers, Extension officers
Approaches to be used in	• Farmer visits
dissemination	Training in workshops
	Publicity campaigns done at county levels.
Critical/essential factors for	1. Availability of the necessary equipment for rapid on the
successful promotion.	spot soil testing.
	2. Established rapport between farmers and the technical
	personnel involved in soil testing.
	3. Adequate qualified staff to cover the large number of
	samples from the target 24 counties before the planting
	season begins.
	4. A well designed storage system for keeping information
	obtained at farm level including (GPS readings, physical
	description of the locations, raw measured scanned data,
	suitability) Availability a year to mount the againment
	5 Formers must understand trust and he willing to act upon
	the information provided
	the information provided
Partners/stakeholders for	• County government extension services: Providing the link
scaling up and their roles	to farmers given that agriculture is devolved
	<ul> <li>Soilcares: Provides soil scanners technology and canacity</li> </ul>
	building in collaboration with KALRO and ICRAF
	• ICRAF and iSDA tests and validates the recommendation
	obtained in collaboration with SoilCares and KALRO
	<ul> <li>Fertilizer companies: To provide fertilizer blends according</li> </ul>
	to soil health status
	• Agro dealers to stock required fertilizers that is readily
	available to farmers
C: Current situation and futur	e scaling un
Counties where already	Technology has not been promoted though testing has been
promoted	ongoing in a few counties
Current extent of reach	Minimal reach at Nyeri County
Counties where TIMP will be	All the 24 KCSAP counties
up scaled	

Challenges in dissemination	• It requires continuous updating methods to improve
	recommendations.
	• Lack of awareness on the importance of regular testing of soil quality
Suggestions for addressing the	• Awareness creation, intensive farmer field training
challenges	(capacity building)
	• Make the whole process cost efficient. Use of scanners
	(spectroscopy) and less wet chemistry analysis.
	<ul> <li>Automated pipermes for updating existing recommendation methods.</li> </ul>
Lessons learned in upscaling if	Timely affordable soil information will guide on fertilizer use.
any	Farmers have reported frustration when they apply the wrong fartilizers and see no results because they did not take the first
	step to understand what the soil demand in terms of macro
	micro nutrients and trace elements like Zinc and Sulphur.
Social anvironmental relieve	• Socially coontable brings income income 6 1
and market conditions	• Socially acceptable-brings income, increases food production putrition security and family cohesion
necessarv	<ul> <li>Environmentally friendly-farmers only apply the required</li> </ul>
	amounts of fertilizers. No excess nutrients to contaminate
	ground and surface water.
	• Increased productivity will provide supply to the markets
	• Supporting frameworks/policies are available.
D: Economic, gender, vulnerab	le and marginalized groups (VMGs) considerations
Basic costs	• Soil testing equipment and consumables, sampling and
	determined upon consultation
	<ul> <li>Shipping selected soil and plant materials for further testing</li> </ul>
	and results verification in a certified lab.
Estimated returns	Dependent on the enterprise adopting the service, but estimated
	at least 30% of current returns and no doubt will be making
	agronomy great again.
Gender issues and concerns in	By bringing services closer to the users saves time and
development, dissemination	resources to the farmers (men, women and youth).
Gender related opportunities	Offers employment especially for the youth where soil
Gender Telated opportunities	sampling champions will be trained to help the local
	community in sampling.
	Retooling of personnel at national and county levels.
VMG issues and concerns in	Willingness to adopt and scaling up technology by VMGs
development, dissemination	given that farmers have not adopted current soil testing services
adoption and scaling up	due to distances and costs
v with related opportunities	This is a Thyle that will bring soll testing services nearer to this
	group of farmers and therefore is a saving and is also expected
	group of farmers and therefore is a saving and is also expected to improve productivity.

_	SoilCares,
	ICRAF and iSDA

### Gaps:

- 1. Testing paired soil and crop samples to determine nutrients in the soil and what is available to plant.
- 2. Determine nutrient deficiency and make recommendation for the type of fertilizer to use and at what rate.
- 3. Developing a fertilizer recommendation system with options for new blends.
- 4. Working with fertilizer companies to produce fertilizer blends packaged in smaller quantities per farmer needs.
- 5. Using scanners at farm level to undertake fertilizer quality analysis, e.g. quantitative and qualitative analysis, major and trace elemental analysis, and chemical and physical analysis.
- 6. Updating existing soil maps with newly acquired soil data to provide current soil fertility status in the country.

2 5.5 TIMP name	Contour bunds	
Category (i.e.	Technology	
technology,		
innovation or		
management		
practice)		
A: Description of the technology, innovation or management practice		
Problem addressed	The risk of soil erosion and increased run off; low soil water retention	
	capacity in most soils	
What is it? (TIMP	Contour bunds are stone or earthen walls built across a slope to prevent	
description)	runoff.	

	Stone wall contour bund Bunds constructed from earth walls
N a b c u	Making furrows parallel to the contours ensures that rainfall and runoff re spread evenly over a field. The earthen bund is formed by excavating channel and creating a small ridge on the downhill side. Thus contour bunds resemble narrow channel terraces commonly referred to as "fanya hini" terraces. The technology is highly suitable for areas with impredictable rains especially the drought-prone areas (ASALs).
Justification	he impacts of climate change such as low and erratic rainfall continue to hreaten agricultural production, food security and livelihoods especially
i	n the ASALs. Contour bunds resemble narrow channel terraces
C	ommonly referred to as "fanya chini" terraces. The aim of contour bunds
a	the reader of the standard by transing run of the rage and furrow area
	rea between them. This also decreases the risk of erosion. Plants with
h	igher water requirements, such as peas or beans, can be planted on the
h	igher side of the furrow whereas cereal crops requiring less water, such
a	s sorghum or millet, can be planted on the ridges.
B: Assessment of disse	mination and scaling up/out approaches
Users of TIMP	Farmers
in dissemination	Approaches to be used in the dissemination include:
in dissemination	<ul> <li>On-faill demonstrations during failler field schools</li> <li>Training in workshops</li> </ul>
	<ul> <li>Fxtension information materials which will be distributed to</li> </ul>
	farmers through farmer groups and the county extension service
	providers.
Most effective approach	Model farm demonstration
Critical/essential factors	• Availability of labour as the technology is labour intensive.
for successful	• Farmers and extension service with skills to design and
promotion	construct contour bunds.
D / . 1 . 1 . 1 . 1	Land tenure systems that allows individual ownership
Partners/stakeholders	• County government extension service providers – delivery of
roles	Community farmer groups Provide on farm demonstration plate
	to hold farmer field schools
	• External service providers – capacity building and access to
	technology

C: Current situation and future scaling up		
Counties where alread	ly Makueni, Machakos, Tharaka Nithi, Kakamega, Nyeri, Meru	
promoted if any		
Current extent of reac	h Practiced extensively among households in Makueni and Machakos	
	especially in the hilly regions	
Counties where TIMP	Busia, Kisumu, Bomet, Kericho Tharaka Nithi, West Pokot, Nyeri,	
will be promoted	Machakos, Taita Taveta, Isiolo, Lamu.	
Challenge(s) in	• Increased risk of soil erosion if contours are improperly laid out	
development and	• Labour intensive and many farmers may find it difficult to	
dissemination	implement at large scale	
	• Land tenure systems – communal land ownership, or in places	
	where individuals don't have land title deeds	
Suggestions for	• Farmers need to be supported with appropriate equipment for	
addressing the	preparation of Contour for efficiency and increased output per	
challenges	man hour.	
	• Training youthful farmers to be champions of Contour bunds construction at the Ward level/village level	
	<ul> <li>Training on site specific designs and construction of contour</li> </ul>	
	bunds	
	Fasttrack land registration	
Lessons learned if an	<ul> <li>Countor bunds ares popular due largely to the rapid benefits they</li> </ul>	
	give in terms of improved crop performance.	
	<ul> <li>Existence of well-developed self-help groups can lead to</li> </ul>	
	successful soil and water conservation activities.	
	• Conducting well publicized campaigns has been found to add to	
	the success of soil and water conservation.	
	• Similarly, when the farmers are adequately trained and sensitized	
	on the technology, many of them would be willing to invest.	
Social, environmental	• Enforce policies on soil and water conservation at the County	
policy and market	level	
conditions necessary	• Create awareness on the importance of soil and water	
	conservation	
	• Avail low cost technologies for soil and water conservation	
	Policies that support individual land tenure systems	
D: Economic, gender	v, vulnerable and marginalized groups (VMGs) considerations	
Basic costs	The main input cost is the labour for <i>contour</i> preparation. The cost will	
	depend on the land size and the landscape terrain/slope	
Estimated returns	The returns depends on the value chain being addressed	
Gender issues and	• Ownership of or access to land may limit women in some regions	
concerns in	• Making decisions on land use may limit women in some region where	
development,	decision making is men dominated	
dissemination,	• Differing accessibility of the technology and information may	
adoption and scaling	disadvantage different gender	
up	• The technology is labour intensive hence may disadvantage women	
	and members who cannot procure labour services	
	• Differing accessibility of information between men and women	
	because of gender norms that place access to new information and	

	technologies in the hands of male heads will affect adoption and
	scaling up.
	• Ownership of or access to land and credit will affect adoption and
	scaling up.
Gender related	• Increased agricultural production will increase access to food and
opportunities	income among all gender.
	• Potential for employment creation - youthful male and women will provide labour during the implementation of the technology.
VMG issues and	• Limited of access to information may limit the VMG from technology
concerns in	access and use
development,	• Limited attendance during awareness and sensitization campaigns due
dissemination,	to physical body challenges or insecurity challenges limits use of
adoption and scaling	technologies.
up	• The technology is labour intensive and may be difficult for the VMG
	to implement in the field.
	• The labour cost of adopting this technology might be out of reach for
	the VMGs thus affecting adoption and scaling up.
	• The technology demands proper training and access to information to
	enable proper implementation. This might be lacking among the
	VMGs
	• Competing priorities and household decisions might hinder adoption
	and scaling up.
VMG related	• Application of contour ridge is expected to improve agriculture
opportunities	production thus, more food and income for the VGMs.
E: Case studies/profi	iles of success stories
Success stories, if	Mukethe Mbithi is a member of the Kyungu Mwethya group in machakos
any	"Before making the terraces we didn't have good harvests because the soil
	was eroded. When we put fertilizer on, the water washed It into the river
	and the maize grew short. But when we made terraces the soil erosion
	stopped and we got good crops.
Application	Soil is excavated up-slope of the bund to a depth of 50 cm. Contour bunds
guidelines for users	should drain in one direction and can be manually or machine constructed.
0	The length of a bund across a slope should be between 400 to 500 m. The
	height of a bund should be at least 25 cm and have an approximate spacing
	of 1-2 m. In arid areas, the distance between bunds can be increased to 5-
	10 m. Hedgerows grown to stabilize bunds should be spaced at 4 to 8 m
	across the slope.

## GAPS

- 1. Develop site specific designs for construction validation in other regions
- 2. Conduct trade off analysis (economic analysis) of contour bunds as a soil and water management technology in the various AEZs and along specific value chains
- 3. Develop low cost mechanized tools to ease labor demands in contour construction and maintenance

2.5.6 TIMP name	Zai Pits	
Category (i.e.	Technology	
technology, innovation		
or management		
practice)		
A: Description of the te	chnology, innovation or management practice	
Problem addressed	Unreliable water to sustain a crop as a result of high seasonal rainfall	
	variability leading to total crop failures. Decreased yields leading to	
	food insecurity.	
What is it? (TIMP	Zai Pits are small planting pits typically measuring 15-30 cm in width,	
description)	10-20 cm deep and spaced 60-80 cm. Zai Pits harvests and stores	
	water for prolonged crop use. Farmers plant seeds into the pits after	
	filling one to three handfuls of organic material such as manure,	
	compost, or dry plant biomass. The technology is highly suitable for	
	areas with unpredictable rains especially the drought-prone areas	
	(ASALs). It is also suited for reclamation of denuded land	
Justification	The impacts of climate change such as low and erratic rainfall	
	continue to threaten agricultural production, food security and	
	livelihoods especially in the ASALs. Zai Pits technology has the	
	potential to harvests and store rain water for prolonged crop use. This	
	technology also contributes to improving the management of degraded	
	lands, reducing soil erosion, vegetation loss and biodiversity as well as	
	grains yield.	
B: Assessment of dissemination and scaling up/out approaches		
Users of TIMP	Farmers	
Approaches to be used	Approaches to be used in the dissemination include:	
in dissemination	On-farm demonstrations during farmer field schools	
	Training in workshops.	
	• Extension information materials which will be distributed to	
	farmers through farmer groups, Agrovets and the county extension	
	offices.	
Most effective	Model farm demonstration	
approach		

Critical/essential	• Availability of labour as the technology is labour intensive.
factors for successful	• Farmers and extension service with skills to design and construct
promotion	Zai pits.
	• Availability of affordable organic matter i.e manure, compost.
Partners/stakeholders	• County government extension services -delivery of information
for scaling up and their	inputs to farmers.
roles	• Community farmer groups – Provide on-farm demonstration plots
	to hold farmer field schools
	• NGOs - capacity building, policy support in soil and water
	conservation issues
C: Current situation an	d future scaling up
Counties where already	Makueni, Machakos, Tharaka Nithi, Kakamega, Nyeri, Meru
promoted if any	
Current extent of reach	Limited adoption because of the costs involved
Counties where TIMP	Busia, Kisumu, Bomet, Kericho Tharaka Nithi, West Pokot, Nyeri,
will be promoted	Machakos, Taita Taveta, Isiolo, Lamu.
Challenge(s) in	The greatest challenge is that the technology is labour intensive and
development and	many farmers may find it difficult to implement at large scale.
dissemination	
Suggestions for	• Farmers need to be supported with appropriate equipment for
addressing the	preparation of Zai Pits for efficiency and increased output per man
challenges	hour.
8	• Training youthful farmers to be champions of Zai pits construction
	at the Ward level/village level.
Lessons learned, if any	The technology has huge potential to increase farmers' resilience
	especially in ASALs. Similarly, when the farmers are adequately
	trained and sensitized on the technology, many of them would be
	willing to invest.
Social, environmental,	• Enforce policies on soil and water conservation at the County level
policy and market	• Create awareness on the importance of soil and water conservation
conditions necessary	• Avail low cost technologies for soil and water conservation
	• Policies that support individual land tenure systems
	• Provide support in the establishment of the Zai pits
D: Economic, gender, v	ulnerable and marginalized groups (VMGs) considerations
Basic costs	The main input cost is the labour for <i>Zai pit</i> preparation. It is estimated
	at Ksh 40 to 100 per Zai Pit
Estimated returns	One acre of land can provide a total of 30 bags of maize (accommodate
	1,778 plant pits each measuring 75 x 75 cm which gives plant
	population of 16,000.). One Zai pit yields a minimum of 1.5 kg of maize
Gender issues and	• Ownership of or access to land, farming inputs and credit is an
concerns in	important gender issue in the adoption of ZAI pits.
development,	• Making decisions on land use, what to grow, expenditures and
dissemination, adoption	savings is an important gender consideration in Zai Pits. This may
and scaling up	disadvantage women
	• Differing accessibility of the technology between men and women
	because of gender norms that place access to new information and
	technologies in the hands of male heads of households is big
	gender concern in adoption

	Ownership of or access to land, farming inputs, information
	technologies (radios, cell phones) and credit will affect adoption
	and scaling up.
Gender related	• Increased agricultural produce will increase access to food and
opportunities	income among women, male and youth.
	• Youthful male and women will provide labour during the
	implementation of the technology.
VMG issues and	• Limited of access to information due to factors like physical
concerns in	disability affects technology access
development,	• In attendance during awareness and sensitization campaigns due to
dissemination, adoption	physical body challenges or insecurity challenges.
and scaling up	• The technology is labour intense and may be difficult for the VMG to implement in the field.
VMG issues and	• The labour cost of adopting this technology might be out of reach
concerns in adoption	for the VMGs thus affecting adoption and scaling up.
and scaling up	• The technology demands proper training and access to information
	to enable proper implementation. This might be lacking among the
	VMGs
	• Competing priorities and household decisions might hinder
	adoption and scaling up.
	• The technology involves carrying of heavy manure to the field
	during establishment which may be difficult for the physically
	weak VMGs.
VMG related	• Application of ZAI pits is expected to improve agriculture
opportunities	production thus, more food and income for the VGMs.
E: Case studies/profiles	s of success stories
Success stories, if any	I wo women groups in Kiliki, Matungulu sub-county of Machakos
	County through a representative Janet Ndunge reported having started
	using the Zai pit farming technology in 2013 after attending a farming
	workshop by the institute for Culture and Ecology (ICE). Ever since we started using Zai pits, we have seen an increase in our harvests as
	compared to the conventional methods of farming "she said
	sompared to the conventional methods of farming, she said.
	Farmers in Kathonzweni, Makueni County increased dug pits from
	170 to 500 pits for crop production due to initial observed benefits.
	Communities in ASALs have also rehabilitated degraded lands and
	increased production by many folds.

Application guidelines for users	Zai pits are 5-15 cm deep, 15-50 cm wide and 80-100 cm apart (Figure 19). In dry areas the size of planting pits can be enlarged. Compost or
	manure is placed in the pits before planting to improve soil fertility. It
	is not necessary to follow the contour when constructing pits. Compost
	It is not necessary to follow the contour when constructing pits. Steps
	to follow in establishing ZAI pits for specific crops are:-
	<i>Sorghum and Millet.</i> The zai pits are during the dry season when labour constraints are minimal. Each pit is 20-30 cm wide, 10-30 cm deep, with the soil from the pit thrown downhill to form a crescent shaped dam. The spacing of the pits within a row, as well as the space between the rows of pits varies between 60 and 100 cm. At the beginning of the
	rains, 200-600 g of dung or compost (two handfuls of organic matter are approximately 300 g) are added to the pits. The organic matter is mixed, in the bottom of the hole, with approximately 5 cm soil. Each pit is then sown with 8-12 millet or sorghum seeds.
	<i>Maize</i> . While growing maize in Zai pits in Kenya, did circular or square holes 30 cm deep. A square hole measuring 75 x75 x 30 (cm) will accommodates nine maize plants. The top soil is mixed with farm yard manure at the ratio of 4:1 and returned. Manure ratio can be reduced while growing maize in Zai pits in Kenya depending on soil quality and use of artificial fertilizers.

# GAPS

1. Validation of the economic viability of the technology in counties where it has never been used.

2.5.7 TIMP name	Bench terraces
Category (i.e.	Technology
technology,	
innovation or	
management	
practice)	

A: Description of the technology, innovation or management practice		
Problem addressed	The risk of soil erosion and increased run off; low soil water retention	
	capacity in most soils	
What is it? (TIMP description)	Bench terraces consist of a series of beds which are more or less level running across a slope at vertical intervals, supported by steep banks or risers (walls or bunds). The flat beds created by bench terraces enable the cultivation of crops on medium to steep slopes. The technology is highly suitable for Semi-arid to humid regions of rainfall, 700 mm or more; medium to steep slopes (12- 47%) (Bench terraces are not recommended for slopes less than 12%); soil depth of greater than 50 cm; and areas with no gullies, nor stones.	
Justification	Agricultural production is threatened in many parts of the Kenya by soil erosion and limited soil moisture. Conservation of soil and moisture through construction of terraces has led to better and more reliable crop yields especially in the ASAL counties of Kenya.	
B: Assessment of di	ssemination and scaling up/out approaches	
Users of TIMP	Farmers	
Approaches to be used in dissemination	<ul> <li>Approaches to be used in the dissemination include:</li> <li>On-farm demonstrations during farmer field schools</li> <li>Training in workshops.</li> <li>Extension information materials which will be distributed to farmers through farmer groups and the county extension service providers.</li> </ul>	
Critical/essential factors for successful	<ul> <li>Availability of labour as the technology is labour intensive.</li> <li>Farmers and extension service with skills to design and construct contour bunds.</li> </ul>	
promotion	• Land tenure systems that allows individual ownership

C: Current situation	n and future scaling up	
Counties where already promoted if any	Makueni, Machakos, Tharaka Nithi, Kakamega, Nyeri, Meru West Pokot	
Current extent of reach	Practiced widely among households in Kakamega, Nyeri and Meru	

Counties where	To be validated in Busia, Kisumu, Bomet, Kericho Lamu.
TIMP will be	
promoted	
Challenge (s) in	• Increased risk of soil erosion if terraces are improperly laid out
dissemination	• Labour intensive during construction and maintenance and many
	farmers may find it difficult to implement at large scale
	• Land tenure systems – communal land ownership, or in places where individuals don't have land title deeds
Suggestions for	• Farmers need to be supported with appropriate equipment for
addressing the	preparation of Bench terrace for efficiency and increased output per
challenges	man nour.
	• Iraining youthful farmers to be champions of making bench terraces
	<ul> <li>Training on site specific designs and construction of bench terraces</li> </ul>
	<ul> <li>Fast track land registration</li> </ul>
Lessons learned if	<ul> <li>Terracing is popular due largely to the rapid benefits it gives in terms</li> </ul>
anv	of improved crop performance.
5	• Existence of well-developed self-help groups can lead to successful
	soil and water conservation activities.
	• Conducting well publicised campaigns has been found to add to the
	success of soil and water conservation.
	• Similarly, when the farmers are adequately trained and sensitized on
	the technology, many of them would be willing to invest.
Social,	• Enforce policies on soil and water conservation at the County level
environmental,	• Create awareness on the importance of soil and water conservation
policy and market	• Avail low cost technologies for soil and water conservation
conditions	• Policies that support individual land tenure systems
D: Economic gende	er vulnerable and marginalized groups (VMCs) considerations
Basic costs	The main input cost is the labour for <i>Bench terrace</i> preparation. The cost
	will depend on the land size. labor costs and the landscape terrain/slope
Estimated returns	The returns depends on the value chain being addressed
Gender issues and	• Making decisions on land use may limit specific gender
concerns in	• Differing accessibility between men and women because of gender
development,	norms places access to new information and technologies in the hands
dissemination,	of male heads of will affect adoption and scaling up.
adoption and	• Ownership of or access to land and credit will affect adoption and
scaling up	scaling up.
Gender related	• Increased agricultural production will increase access to food and
opportunities	income among all gender.
	• Both men and women will provide labour during the implementation
	of the technology.
VMG issues and	• The labour cost of adopting this technology might be out of reach for the VMCs thus effecting a lastic series of a sell.
development and	the VMGs thus affecting adoption and scaling up.
dissemination	• I ne technology demands proper training and access to information to
aissemmation	VMGs
	4 (VII) 5

	• Lack of access to information will limit the VMG accessing and
	adopting the technology
	• Competing priorities and nousehold decisions might hinder adoption and scaling up.
VMG related	• Application of bench terraces is expected to improve agriculture
opportunities	production thus, more food and income for the VGMs.
E: Case studies/pro	files of success stories
Success stories, if	Mukethe Mbithi is a member of the Kyungu Mwethya group in machakos
any	"Before making the bench terraces we didn't have good harvests because
	the soil was eroded. When we put fertilizer on, the water washed It into the
	river and the maize grew short. But when we made terraces the soil
	erosion stopped and we got good crops.
Application	Terraces draining in one direction should be at least 100m or more. The
guidelines for users	length can be slightly increased in arid and semi-arid regions. The width of
	the bench (flat part) is determined by soil depth, crop requirements, and
	tools to be used for cultivation. Optimum width of terrace benches ranges
	from 2.5 to 5 m for manually constructed ones and from 3.5 to 8 m for
	machine built and tractor-cultivated ones.
	Terraces should drain runoff along the horizontal gradient of the slope,
	either in outward or reverse direction. The outward gradient can range from
	0.5% in arid or semi-arid regions to 3% in humid regions with clay soils.
	Maximum gradients can be 5% for reverse terraces. In high rainfall areas
	(more than 1000 mm annually), it is necessary to make additional drainage
	provisions off the terraces – although this has a risk of causing erosion on
	very steep slopes. These additional drainage channels should be trapezoidal
	in snape and planted with grass to prevent crossion. Machine construction is
	possible on slopes of 12-30% while manual construction can be used on

2.5.8 TIMP name	Fanya juu terraces
Category (i.e.	Technology
technology,	

innovation or	
management	
practice)	
A: Description of th	e technology, innovation or management practice
Problem addressed	The risk of soil erosion and increased run off; low soil water retention capacity in most soils
What is it? (TIMP description)	Fanya juu terraces (juu is Swahili word for 'up') are constructed by excavating soil and throwing it up-slope to make an embankment. The embankment forms a runoff barrier and the trench (ditch) is used to retain or collect runoff. The embankments are usually stabilized with fodder grasses. Crops, such as bananas, pawpaws, citrus and guava, are grown in the ditches. Through gradual redistribution of soils within the field, the terraces level off.
	Laying out "Fanya juu" terraces "Fanya juu" terraces
	The technology is highly suitable in low annual rainfall areas (less than 700 mm); moderate slopes (less than 20%); deep soils (more than 60 cm); and hilly areas that are subject to widespread erosion.
Justification	The impacts of climate change such as low and erratic rainfall continue to threaten agricultural production, food security and livelihoods especially in the ASALs. Agricultural production is threatened in many parts of the Kenya by soil erosion and limited soil moisture. Conservation of soil and moisture through construction of terraces has led to better and more reliable crop yields
D. A	especially in the ASAL counties of Kenya.

Basic costs	The main input cost is the labour for terrace preparation. The cost will depend
	on the land size and the landscape terrain/slope
Estimated returns	The returns depends on the value chain being addressed
Gender issues and	• Ownership of or access to land may limit women in implementing the
concerns in	technology
development,	• Limited decision making power on land use may limit women in accessing
dissemination,	and adopting the technology
adoption and	• Differing accessibility of the technology and information may
scaling up	disadvantage women and in some instances men
	• Limited access to credit will affect adoption and scaling up among
	women.
Gender related	• Increased agricultural production will increase access to food and income
opportunities	among all gender.

	• Youthful male and women will provide labour during the implementation of the technology.
VMG issues and	<ul> <li>Limited access to information will limit access to information and</li> </ul>
concerns in	adoption
development and	• Limited decision making power on land use may limit VMG in accessing
dissemination	and adopting the technology
	• May not be in attendance during awareness and sensitization campaigns
	due to physical body challenges or insecurity challenges.
	• The technology is labour intense and may be difficult for the VMG to
	implement in the field.
	• The labour cost of adopting this technology might be out of reach for the
	VMGs thus affecting adoption and scaling up.
	<ul> <li>The technology demands proper training and access to information to</li> </ul>
	enable proper implementation. This might be lacking among the VMGs
VMG related	• Application of contour ridge is expected to improve agriculture
opportunities	production thus, more food and income for the VGMs.
E: Case studies/pro	files of success stories
Success stories, if	Over 50,000 smallholder farmers in lower eastern counties of Kenya are
any	recording a more than doubling of yields and reduced soil erosion after
	embracing a soil conservation scheme that involves digging of trenches in
	hillside to trap runaway water and soil.
Application	The 'fanya juu' trench is 60 cm wide by 60 cm deep, and the bund 50 cm high
guidelines for users	by 150 cm across. In arid regions the trenches can be enlarged to 100 cm deep
	and 150 cm wide. Distance between bunds can be from 5 m on steep slopes to
	20 m on gentle slopes. Stone terrace walls can be built to reinforce the bunds
	on very steep slopes to allow surplus water to pass between the stones without
	damaging the terrace. Excess water can be drained from the trenches using cut-
	off drains.

2.5.9 TIMP name	Tied ridges
Category (i.e.	Technology
technology,	

innovation or	
management	
practice)	
A: Description of th	e technology, innovation or management practice
Problem addressed	Crop water stresses in production; Increased water losses in the furrows
What is it? (TIMP	Tied ridges are small earthen ridges, 30 cm high, with an upslope furrow
description)	which accommodates water between the ridges.
	Tied ridges Green gram in Tied ridges Technology consist of water flowing down the small trenches/furrows running parallel and infiltrates into crop root zones. Water is applied to the
	top end of each furrow and flows down the crop field under the influence of gravity.
Justification	With limitations in soil moisture due to decreasing rainfall occasioned by
	climatic changes, tied ridges helps conserve soil moisture. In combination
	with furrow irrigation, the technology has potential to improve agricultural
	productivity and increase crop yields and cropping intensities. As a result,
	household food security, incomes and livelihoods are enhanced.
Region promoted	Tana River, Garissa, and West Pokot counties
B: Assessment of di	ssemination and scaling up/out approaches
Users of TIMP	Farmers
Approaches used in dissemination	Demonstrations; Farmer field schools
Critical/essential	• Proximity to water sources - close to permanent water sources
factors for	• Suitable topography of area (level land)
successful	Technical capacity for maintenance
promotion

Gaps1. The economic viability of the technology in different agro-ecological zones

2.5.10 TIMP name	Conservation Agriculture (CA)
Category (i.e.	Management Practice
technology,	
innovation or	
management	
practice)	
A: Description of the	technology, innovation or management practice
Problem to be	Land degradation characterized by the declining soil fertility, low yields,
addressed:	increased soil moisture stress, increased soil erosion and loss of
	biodiversity
What is it? (TIMP	Conservation agriculture is an approach to farming which can sustainably
description)	increase crop yields. The various practices that make up this approach
	follow key principles that target to conserve the soil, soil moisture, and
	soil-nutrients, and stabilise land production while reducing production
	costs. Conservation agriculture principles are:
	1. Minimal soil disturbance

	Minimum tillage         2. Permanent ground cover - maintenance of a mulch of carbon-rich organic matter covering and feeding the soil (e.g. straw and/or other crop residues including cover crops)         Image: Straw and/or other crops         Image: Straw and Straw a
Justification	<ul> <li>Land productivity is decreasing leading to decreased yield. Continuous land operation continues to emit more GHGs (Carbon) responsible for the climatic changes. Conservation agriculture (CA) has potential to:</li> <li>Enhance management of soil fertility and organic matter, and improvement of the efficiency of nutrient inputs, helping to produce more with proportionally less fertilizer.</li> <li>Rotations and crop associations that include legumes are capable of hosting nitrogen-fixing bacteria in their roots; this contributes to optimum plant growth without increased GHG emissions induced by fertiliser production</li> <li>Avoidance of tillage minimises occurrence of net losses of carbon dioxide by microbial respiration and oxidation of the soil organic matter and builds soil structure and biopores through soil biota and roots</li> </ul>
	<ul> <li>The protective soil cover of leaves, stems and stalks from the previous crop shields the soil surface from heat, wind and rain, keeps the soil cooler and reduces moisture losses by evaporation</li> <li>Helps to reduce soil compaction and plough pans and regenerates degraded lands</li> </ul>
----------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------
B: Assessment of diss	semination and scaling up/out approaches
Users of TIMP	Farmers, Extension Agents, Researchers
Approaches to be used in dissemination	Agricultural shows, Mass media, Chief's Baraza, Exhibitions, Farmer field Schools (FFS), On-farm and on-station demonstrations, Field Days, Extension Officers
Critical/essential	Training on principles and benefits of CA

Partners/stakeholder s for scaling up,	County Extension officers - Dissemination of information, capacity building
their roles and stage of involvement	<ul> <li>NGO's (African Conservation Network, One Acre Fund)- Capacity Building, Dissemination of information</li> <li>CIAT FAO – capacity building</li> </ul>
	<ul> <li>County Governments - Funding CA activities, support capacity building, enabling environment and supportive policies</li> </ul>
<b>C:</b> Current situation	and future scaling up
Counties where already promoted if any	Bungoma, Meru, Embu, Tharaka Nithi, Laikipia, Kakamega
Current extent of reach	Practiced in several counties but among very few households due to various constraints
Counties where TIMP will be upscaled	Bungoma, Meru, Embu, Tharaka Nithi, Laikipia, Kakamega, Machakos, Makueni
Challenges in dissemination	<ul> <li>Non-availability of crop residue in suitable quantities</li> <li>Competition for crop residues with other uses like wood fuel and livestock</li> </ul>
	<ul> <li>Land tenure (farmers reluctant to invest in CA where they do not have clear land rights)</li> <li>Limited knowledge on the incremental benefits of CA</li> <li>Limited access to CA implements</li> </ul>
Suggestions for addressing the	<ul> <li>Enhance Public Private Partnerships (PPP) to support increased production and market access</li> </ul>
challenges	<ul> <li>Improve KALRO and county government capacity to train and re-tool technical team so as to enhance uptake of the technology</li> <li>Allocation of more funds for continued research and dissemination of this technology would aid increased uptake of CA with agroforestry</li> </ul>
Lessons learned in upscaling if any	<ul> <li>Uptake of CA technology increases with the realized incremental benefits over time</li> <li>Continuous capacity building increases CA technology uptake</li> </ul>

Social,	• Develop Integrated Herbicide Management Plan – pre-emergence and
environmental,	post-emergence herbicides
policy and market	• Reliable technology adoption and suitable price and market access for
conditions necessary	produce under CA
for development and	• Continuous capacity building of the community on the benefits of CA
dissemination	technology
	• County policies that support households investing in CA with inputs
	like implements
D: Economic, gender	, vulnerable and marginalized groups (VMGs) considerations
Basic costs	Costs related to ripping services and herbicides amount to KES 5000/acre.
	This is apart from the normal inputs of seed and fertilizer when
	establishing. But the costs of reduce over the years, while the returns
	increase
Estimated returns	• Reduction of costs associated with tillage-induced soil erosion and
	degradation i.e. 40% of land degradation
	• Returns on conserving soil exceeding 150 ton/hectare annually and
	associated increased productivity
Gender issues and	• CA with trees is a management practice that that can be easily adopted
concerns in	by women
development,	• Reduces labor demands across all gender, hence good for all gender
dissemination,	• Land ownership is mainly by men therefore reducing wider adoption
adoption and scaling	• Women are usually left out of decision making thereby reducing
up	uptake
Gender related	CA with agroforestry provides opportunities for Small Medium
opportunities	Enterprises (SMEs) e.g. tree nurseries. The technology therefore renders
11	itself to easy adoption by women
VMG issues and	• Limited decision making on land use may limit the adoption by VMGs
concerns in	• Limited access to CA inputs like planting implements may limit the
development,	VMGs adopting
dissemination,	
adoption and scaling	
up	
VMG related	• Opportunity to run SMEs such as tree nurseries for increased
opportunities	resilience
E: Case studies/profi	les of success stories
Success stories from	Farmers and agro-pastoralists who adopt the technology have had
previous similar	sustainable source of income and increased resilience
projects	
Application	When implementing the 3 principles of CA, one needs to note the following
guidelines for users	Timely Operations - preparing the land in good time before the rains
	start; planting soon after an effective rainfall event; weeding at
	appropriate times and intervals; doing effective pest and disease
	control before either spread too widely.
	Precise Operations - Precise measurements of row and plant spacing,
	evenness of depth and placement of soil amendments and covering of
	seed are also important. Planting should be done on the same lines
	each season
	Inputs – Equipment, seeds, herbicides, manures/fertilizers – use the
	right inputs

	<ul> <li>Livestock - try to keep livestock out of the fields, even after harvesting the crop.</li> <li>References</li> <li>Okoba, B. ## Gaps

- 1. Identification of the most suitable diversified crop rotations and suitable crops for biomass for the different counties.
- 2. Development of suitable CA implements/field equipment prototypes.
- 3. Capacity building on the benefits and operationalization of Conservation Agriculture systems both among extension and technical staff, and at decision-making levels:

2.5.11 TIMP	Multiple cropping (Intercropping)	
name		
Category (i.e. technology, innovation or management proation)	Complementary technology	
A: Description of the technology innovation or management practice		
Problem addressed:	<ul> <li>Decreased yields, hence low farm returns</li> <li>Declining soil fertility, hence soil degradation</li> <li>Soil erosion problems - runoff are minimized</li> <li>Weeds infestation – manage using increased soil cover crops</li> <li>Vulnerability to crop pests - practice helps slow the proliferation of pests and protect yields</li> </ul>	
What is it? (TIMP description)		

Justification	Intercropping is the growing of two or more crops in close proximity (in the same row or bed, or in rows or strips that are close enough) for biological interaction. It also includes the growing of two or more cash crops together. The practice offers the potential to increase yields, enhance soil fertility and minimize the effects of climate change. Climate change is negatively impacting agricultural productions. Farmers are experiencing low yields, crop failures, declined soil fertility and generally low farm returns from their investments. Intercropping is one of the potential	
	<ul><li>The practice is known to build healthy soils, control pests and harness a variety of benefits to increase yields. Intercropping of compatible plants encourages biodiversity by providing a habitat for a variety of insects and soil organisms that would not be present in a single-crop</li></ul>	
	environment. The practice have several advantages. First, an intercrop may use resources of light, water, and nutrients more efficiently than single crops planted in separate areas, and this can improve yields and income. Secondly, crop mixtures frequently have lower pest densities, especially of insect pests. This occurs both because the mixture confuses the insects and, if chosen carefully attracts beneficial predators. Finally, intercropping may allow more effective management of cover crops.	
B: Assessment of dissemination and scaling up/out approaches		
Approaches to be used in dissemination	Farmers and wide range of users in the rural and urban areas         Demonstrations, Agricultural shows and Extension services	
Critical/essential factors for successful promotion	<ul> <li>Awareness creation on the benefits and contribution of the practice to all stakeholders.</li> <li>Easy access of crop varieties that are compatible with associated crops planned for intercrop.</li> <li>Technical packages describing appropriate schedules of planting intercrops.</li> <li>Package on fertilizer rates and regimes under the practice.</li> </ul>	
Partners/stakehold ers for scaling up	County governments – to provide extension services, farmer mobilization and policy formulation	

services         Services         Current situation and future scaling up         Counties where already promoted       Most Counties in the medium to high rainfall areas & Arid and semi-arid areas         Current extent of reach       Although farmers in these counties practice intercropping, most fall short of using the right seed and agronomic practices, hence do not benefit from the technology         Counties where TIMP will be       All the 24 KCSAP Counties
C: Current situation and future scaling up         Counties where already promoted       Most Counties in the medium to high rainfall areas & Arid and semi-arid areas         Current extent of reach       Although farmers in these counties practice intercropping, most fall short of using the right seed and agronomic practices, hence do not benefit from the technology         Counties where TIMP will be       All the 24 KCSAP Counties
Counties where       Most Counties in the medium to high failing areas & And and semi-and areas         Current extent of reach       Although farmers in these counties practice intercropping, most fall short of using the right seed and agronomic practices, hence do not benefit from the technology         Counties where       All the 24 KCSAP Counties
Current extent of reach       Although farmers in these counties practice intercropping, most fall short of using the right seed and agronomic practices, hence do not benefit from the technology         Counties where TIMP will be       All the 24 KCSAP Counties
Counties where TIMP will be     All the 24 KCSAP Counties
Include     Counties where       TIMP will be     All the 24 KCSAP Counties
Counties where All the 24 KCSAP Counties
TIMP will be
upscaled
Challenges in • Limited access and wide distribution of clean planting materials
dissemination (intercrop varieties)
• Inadequate access of technical materials on the establishment,
operations and management of intercrop management practice by
farmers
• The increased effects of climate change hindering adoption.
• Farmer high poverty levels coupled with illiteracy especially in deep
rural areas of Kenya.
Suggestions for • Enhance access of clean planting materials across the counties. Work
addressing the closely with certified seed merchants, research institutions
• Train and sensitize farmers on the basic principles of intercropping,
their benefits and types suitable to their contexts. Use farmer field
schools and demonstrations
• Develop a comprehensive manual on the practice to guide the farmers
during the adoption
Lessons learned in The practice is very important in pest management. Farmers can use a trap
up-scaling, if any crop to attract pests, keeping them away from the main crop. Therefore,
farmers can easily adopt this method to significantly cut down on pesticides
input costs
The number of ecological benefits provided by this practice can also
accelerate up scaling. Intercropping promotes interactions between crops
and pollinators, thus supporting biodiversity and wildlife species.
• Socially accepted by both male and female gender.
• The practice is environmentally friendly as it enhances biodiversity,
controls erosion and minimizes use of pesticides
conditions
De Economia gander vulnerable and marginalized groups (VMCs) considerations
Basic costs This is a low cost management practice though technically demending
especially where the objective is to control pest through intercropping
Estimated returns Dependent on the value chain intercrop
Gender issues and • The practice integrates participation of both male and female conder
concerns in roles during field implementation
development It is important to know the demands of the technology product and users
dissemination discrete and acceptability

	• Gender disparities in access to information may impact on adoption
	decisions. Access to information is a pre-requisite for informed
	decisions on adoption.
Gender related	Intercropping offers good opportunities to both men and women to grow
opportunities	diverse crops for economic gains and at the same time offers enhanced biodiversity benefits
VMG issues and	The technology can be practiced using locally available and low cost
concerns in	materials and hence enhances adoption by the vulnerable and marginalized
development,	farmers/users. However, for optimized benefits, the availability of the
adoption and	required inputs like clean planting materials and appropriate tertilizers can be a challenge to these vulnerable group of people
scaling up	be a chanenge to mese vulnerable group of people.
VMG related	Intercropping places emphasis on the importance of using available land
opportunities	space to grow a diverse of food, increase biodiversity, pest management thus
11	the practice is economically viable. The practice is available and cost
	effective to the advantage of VMG.
E: Case studies/pro	files of success stories
Success stories	Farmers have reported improved soil conditions, reduced runoff and
	nutrient loss, soil moisture retention in the soil and generally an increased
	available management practice
Application	<ul> <li>Intercropping scheme is aimed at improving the overall economics of</li> </ul>
guidelines for	the farm. It is for this reason any new intercropping idea should first be
users	tested on a relatively small area for evaluations
	• Observe careful timing of field operations (sometimes necessitating
	special interventions) to keep competition between the intercropped
	species in balance
	• A crop mix that works well in one year may fail the next if weather favors one crop over another
	• A mixture of crops with different growth forms or timing of
	development may make cultivation and use of mulches more difficult
	and less effective
	• Planting crops in alternate rows or strips greatly simplifies management
	and captures some of the benefits of intercropping for pest control
	• Intercropping poses a special problem for crop rotation. This is because
	if plants from two families are mixed in the same bed or field, achieving
	a substantial time lag before replanting either of those families may be
	<ul> <li>Intercropping requires extra care and effort in planning and maintaining</li> </ul>
	a viable crop rotation.
F: Status of TIMP	Requires validation and further research
readiness	
unscaling.	
2=Requires	
validation;	
3=Requires further	
research	

G: Contacts		
Contacts	Director

and scientists		
Partner	County governments,	
organizations	KCEP-CRAL project	

#### Gaps

- 1. Major information gaps on intercropping performances in specific areas of Kenya. For example there hasn't been much research on optimal levels of fertilizer use for intercropping sorghum and peanuts in some areas the need for site specific validation.
- 2. Little information on the interactions of various crop intercrops especially in the arid and semi-arid areas (ASALs).
- 3. Limited knowledge on resource-use efficiency particularly in regions with impoverished soils (ASALs) and economies where measured benefits is greatest.

#### 2.6 Green Gram Diseases

2.6.1 TIMP name	Integrated Management of Rust disease of green grams
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technolo	gy, innovation or management practice
Problem addressed	Yield loss due to crop damage by the disease
What is it? (TIMP description)	<ul> <li>Integrated management of Rust consists of several approaches applied in an integrated manner to break the disease cycle. These include: cultural management and chemical control.</li> <li>Cultural management options: <ul> <li>Plant early using certified seeds.</li> <li>Practice crop rotation with non-legumes for a period of 2-3 seasons.</li> <li>Uproot and destroy severely affected plants, including weeds and volunteer crops by deeply burying them.</li> <li>Do not walk through your field during wet weather to prevent the spread of the disease from one plant to another.</li> <li>Ensure that field sanitation and hygiene practices are adhered to by collecting and safely disposing infected plants by deeply burying them.</li> </ul> </li> </ul>
	<ul> <li>Chemical control options:</li> <li>Spray copper based products such as copper oxychloride (cuprocaffaro micro 37.5 at a rate of 50 gm/20 litres water or Isacop 50WP at a rate of 60 g/20 litres of water) once initial symptoms are observed.</li> </ul>

	Bean rust (Uromyces phaseoli)         (Source; Ruth Amata, KALRO)	
Justification	Rust is a major challenge in green gram production in Kenya,	
	occurring in all major production areas. The disease is severe	
	because the pathogen produces abundant spores which cover	
	leaves reducing the plants photosynthetic area. This causes	
	significant yield loss both in terms of quantity and quality.	
	Integrated Disease Management is an environmental friendly	
	approach to disease control which enables the alleviation of yield	
	loss due to disease damage.	
B: Assessment of dissemination and scaling up/out approaches		
Users of TIMP	Producers, Exporters, Farmers, Processors, Extension service	
	providers, Researchers, Academia	
Approaches to be used in	• On farm and on station research trails and demonstrations	
dissemination	Training workshops, Seminars, Meetings	
	Field days     A gricultural shows	
	<ul> <li>Farmer research networks</li> </ul>	
	<ul> <li>Farmer to farmer</li> </ul>	
	Mass media – Agricultural programs	
	• Promotional materials (posters/brochures/leaflets, manuals)	
	Web materials	
	Digital platforms	
	• Farmer Field and Business Schools (FFBS)	
Critical/assential factors for	Agricultural innovation Platforms	
successful promotion	<ul> <li>Strong partnership linkages</li> <li>Carry out Applied and adaptive research to validate and</li> </ul>	
successful promotion	release improved green gram varieties	
	• Create a platform for interaction of green gram value chain stakeholders	
	• Farmers adopt appropriate agronomic practices.	
	Form well organized farmer groups and networks	
Partners/stakeholders for	KALRO to continually undertake research in disease management	
scaling up and their roles	KEPHIS to ensure seedling quality is maintained	
	management	

	Farmers/farmer groups to adopt the technologies	
	County governments, central governments for development of	
	enabling policies and create awareness.	
	Financial institutions to provide credit facilitators.	
	Extension service providers (public and private) to help in the	
	dissemination.	
	CGIAR's	
	NGOs: technology dissemination through on-farm	
	demonstrations; capacity building of farmers	
C: Current situation and future scaling up		
Counties where already	All counties with agro-ecological settings suitable for green	
promoted, if any	gram production	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,	
be upscaled	Baringo, Tana River	
Challenges in dissemination	• Limited knowledge by farmers on integrated disease	
	management practices	
	• Few farmer groups	
	• Lack of green gram innovation platforms to facilitate	
	interaction of farmers with relevant stakeholders.	
Suggestions for addressing	• Establish green gram innovation platforms	
the challenges	• Dissemination of integrated disease management practices	
	and safe use of pesticides	
Lessons learned in up scaling,	• Adoption of good agricultural practices by the producers is	
if any	key in management of the disease.	
	• Chances of successful scaling are higher when many value	
	chain stakeholders collaborate in an innovation platform	
	• Partnership is important in dissemination and adoption of the	
	management practice and this can be facilitated through	
	innovation platforms	
	• More than one approach is used in monocompart of moior	
	• More than one approach is used in management of major	
	ulseases.	
	• IDM is environment friendly and the chemical option should	
	be used as the last resort	
	• Participatory, farmer-centered approaches, which encourage	
	farmers to participate in the innovation process and the	
	facilitation of experimentation among farmer communities in	
	the evaluation of the technology enhances technology	
	adoption.	
Social, environmental, policy	• Understanding the physical and biotic environment in target	
and market conditions	ecologies: understanding community culture preferences	
necessary for development	and practices	
and up scaling	and practices	
and up scanng		

	• Training on IDM to increase awareness of IDM and reduce
	possible negative impact on the environment resulting from
	wrong application of IDM
	• Market able to absorb increased supply of grain.
	• Regulatory bodies e.g. PCPBP, KBS to ensure fungicides sold
	to farmers are genuine and of high quality
	• Producers willing to adopt the disease management practices
	• Producers are organized in groups to ensure that management
	practices are effectively up-scaled
	• Farm input costs are within the reach of farmers.
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	19,200/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by
	60% (43, 200/=). Therefore, the estimated returns will be
	72,000-43, 200= 28,800/=
Gender issues and concerns in	• Women and youth have limited access to productive
development, dissemination	resources such as land, credit, and quality seeds than men
adoption and scaling up	• Women and youth have limited access to education, training
	and extension services than men
	• Women have limited access to agro-vets as they sometimes
	cannot travel to far markets due to their domestic roles
	Woman have loss access to agricultural information
	• women have less access to agricultural information,
	technology and knowledge
	• Women might have limited knowledge on integrated
	management of rust disease
Gender related opportunities	• Opportunities for youths exists in spraying the crop
	• Increased production leading to stable markets for green
	gram
VMG issues and concerns in	• VMGs have limited access to productive resources such as
development, dissemination	land, credit and quality seeds
adoption and scaling up	• VMGs have limited access to training and extension services
	• VMGs have limited access agro-vets as they sometimes
	sickness disability or lack of exposure
	<ul> <li>Due to their social status VMGs are often excluded from</li> </ul>
	decision making in development and dissemination activities
	• VMGs have limited access to seed and information on new
	varieties and production techniques
	• There is low adoption by VMGs due to lack of awareness
VMG related opportunities	The management practice can improve food and nutrition
	security and a window for increased income.

2.6.2 TIMP name	Integrated Management of anthracrose disease of green
2.0.2 IIIII hame	grams
Category (i.e. technology	Management practice
innovation or management	management practice
ninovation of management	
	·
A: Description of the technolo	bgy, innovation or management practice
Problem addressed	Yield loss and low grain quality due to disease
What is it? (TIMP	Integrated management of anthracnose encompasses the use of
description)	various approaches in management of the diseases and are applied
	during pre-harvest stage. They include: cultural management,
	deployment of tolerant varieties and chemical control.
	Cultural practices:
	• Use certified seeds
	<ul> <li>Practice crop rotation with non-legumes.</li> </ul>
	• Work in uninfected parts of the field first before the infected area.
	• Avoid unnecessary movement in infected areas to
	minimize spread of the disease, disinfect farm implements
	after working from one field before proceeding to the other.
	• Hot water treatment of grains at 54° for 10min.
	Grow tolerant varieties:
	• Grow varieties that are less susceptible to the disease such as BGS-9, TM-98-50 and TM-97-55.

	Chamical management.
	<ul> <li>Applying fungicides from flower-bud formation stage until when pods are fully developed. The most susceptible stage is bud-formation, flowering period and early pod development.</li> <li>Spraying Carbendazim 500g or Mancozeb 2kg/ha soon after the appearance of disease and repeat after 15 days.</li> <li>Spraying other fungicides such as Copper based fungicides e.g. Cuprocaffaro WP, Trifloxystrobin + Tebuconazole based fungicides e.g. Nativo 300 SC or Carbendazim based fungicides e.g. Rodazim SC in strict adherence to manufacturer's instructions.</li> <li>With the experimentation of the experimentation of the experimentation of the experimentation.</li> </ul>
Justification	Anthracnose causes up to 40% grain losses and reduces market quality of green grams in Kenya. Losses occasioned by the diseases lead to reduced returns for the farmers and negatively impacts on food and national security of the country.
B: Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Producers, Exporters, Farmers, Processors, Extension service
	providers, Researchers, Academia
Approaches to be used in dissemination	<ul> <li>On farm and on station research trails and demonstrations</li> <li>Training workshops, Seminars, Meetings</li> <li>Field days</li> <li>Agricultural shows</li> <li>Farmer research networks</li> <li>Farmer to farmer</li> <li>Mass media – Agricultural programs</li> <li>Promotional materials (posters/brochures/leaflets, manuals)</li> <li>Web materials</li> </ul>
	<ul> <li>Digital platforms</li> <li>Farmer Field and Business Schools (FFBS)</li> <li>Agricultural Innovation Platforms</li> </ul>

Critical/essential factors for	• Carry out Applied and adaptive research to validate and
successful promotion	release improved green gram varieties
r	• Create a platform for interaction of green gram value chain
	stakeholders
	• Farmers adopt appropriate agronomic practices
	• Form well organized farmer groups and networks
Partners/stakeholders for	KALRO to continually undertake research in disease
scaling up and their roles	Management
	PCPB to promote registration of fungicides for disease
	management
	Farmers/farmer groups to adopt the technologies
	County governments, central governments for development of
	enabling policies and create awareness.
	• Financial institutions to provide credit facilitators
	• CGIAR
	NGOs: technology dissemination through on-farm
	demonstrations; capacity building of farmers
C: Current situation and futu	re scaling up
Counties where already	-
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	• Farmers are not receptive to cultural methods of managing
	diseases e.g. Crop rotation is difficult to implement for
	farmers with small land holdings and limited economic
	resources.
	management practices
	<ul> <li>Few farmer groups</li> </ul>
	• Lack of green gram Innovation Platforms to facilitate
	interaction of farmers with relevant stakeholders
Suggestions for addressing	Establish green gram innovation platforms
the challenges	• Dissemination of integrated disease management practices
	and safe use of pesticides
	• Promote appropriate marketing channels e.g. contract
Lessons learned in up scaling.	<ul> <li>Adoption of good agricultural practices by the producers is</li> </ul>
if any	key in management of the diseases
	• Chances of successful scaling are higher when many value
	chain stakeholders collaborate in an innovation platform
	• Partnership is important in technology dissemination and
	adoption and this can be facilitated through innovation
	More than one approach is used in management of the disease
	• IDM is environment friendly and the chemical component
	should be used judiciously as the last resort

Social, environmental, policy and market conditions necessary for development and up scaling	<ul> <li>Participatory, farmer-centered approaches, which encourage farmers to participate in the innovation process and the facilitation of experimentation among farmer communities in the evaluation of the management practice enhances adoption</li> <li>Regulatory bodies e.g. PCPBP, KBS to ensure fungicides sold to farmers are genuine and of high quality</li> <li>Producers willing to adopt the disease management practices</li> <li>Producers are organized in groups to ensure that management practices are effectively up-scaled</li> <li>Farm input costs are within the reach of farmers.</li> <li>Understanding the physical and biotic environment in target ecologies; understanding community culture, preferences, and practices</li> </ul>
	• Training on IDM to increase awareness of IDM and reduce possible negative impact on the environment resulting from wrong application of IDM
	Market able to absorb increased supply of grain
D: Economic, gender, vulnerable and marginalized groups (VMGs) considerations	
Basic costs	18,000/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by
	40% (28,800/=). Therefore, the estimated returns will be
	72,000-28,800= 43,200/=
Gender issues and concerns in development, dissemination adoption and scaling up	<ul> <li>Women and youth have limited access to productive resources such as land, credit, and quality seeds than men</li> <li>Women and youth have limited access to education, training and extension services than men</li> <li>Women have limited access to agro-vets as they sometimes cannot travel to far markets due to their domestic roles</li> <li>Women have less access to agricultural information, technology and knowledge</li> <li>Women might have limited knowledge on integrated management of anthracnose</li> </ul>
Gender related opportunities	<ul> <li>Opportunities for youth employment in implementing IDM protocols</li> <li>Opportunities in marketing pest traps</li> </ul>
VMG issues and concerns in	The management practice reduces production costs therefore
development, dissemination	VMG's can afford to produce green grams
adoption and scaling up	
VMG related opportunities	The technology can improve food and nutrition security and a
	window for increased income.

2.6.3 TIMP name	Integrated Management of powdery mildew disease of green
	grams
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technolo	ogy, innovation or management practice
Problem addressed	Yield loss of between 21% due to green gram infection by the
	disease
What is it? (TIMP description)	<ul> <li>Integrated management of powdery mildew consists of several approaches applied in an integrated manner to break the disease cycle. These include: cultural management and chemical control.</li> <li>Cultural management options: <ul> <li>Plant early using certified seeds.</li> <li>Practice crop rotation with non-legumes for a period of 2-3 seasons.</li> <li>Uproot and destroy severely affected plants, including weeds and volunteer crops by burying them deeply.</li> <li>Do not walk through your field during wet weather to prevent the spread of the disease from one plant to another.</li> <li>Ensure that field sanitation and hygiene practices are adhered to by collecting and disposing infected plants by deeply burying them.</li> </ul> </li> </ul>

	Chamical management antions:
	<ul> <li>Spraying copper based products such as copper oxychloride (cuprocaffaro micro 37.5 at a rate of 50 gm/20 litres water or Isacop 50WP at a rate of 60 g/20 litres of water) once initial symptoms are observed.</li> </ul>
	Fowdery mildew (Erysiphe polygoni) (Source; Daniel Mutisya KALRO)
Justification	Powdery mildew disease is a major challenge in green gram production in Kenya, occurring in all major production areas. The disease is severe because the pathogen produces abundant spores which cover leaves reducing the plants photosynthetic area. This causes significant yield loss both in terms of quantity and quality. Integrated Disease Management is an environmental friendly approach to disease control which enables the alleviation of yield loss due to disease damage.
<b>B:</b> Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Farmers, Exporters, Processors, Extension service providers, Researchers, Academia
Approaches to be used in dissemination	<ul> <li>On farm and on station research trails and demonstrations</li> <li>Training workshops, seminars and meetings</li> <li>Field days</li> <li>Agricultural shows</li> <li>Farmer research networks</li> <li>Farmer to farmer</li> <li>Mass media – Agricultural programs</li> <li>Promotional materials (posters/brochures/leaflets, manuals)</li> <li>Web materials</li> <li>Digital platforms</li> <li>Farmer Field and Business Schools (FFBS)</li> <li>Agricultural innovation platforms</li> </ul>

Critical/essential factors for	• Undertake applied and adaptive research to validate and
successful promotion	release improved green gram varieties
	• Create a platform for interaction of green gram value chain stakeholders
	• Farmers adopt appropriate agronomic practices.
	• Have well organized farmer groups and networks.
	Strong partnership linkages
	• Need for farmer involvement helps generate locally specific
	techniques and solutions suitable for their particular farming
	systems and integrating control components that are
	ecologically sound and readily available to them e.g. Use of
	and adopted factor
	• Accessibility and cost of the practice by farmers: low-cost
	agricultural practices are easily promoted and accepted
Partners/stakeholders for	• KALRO to continua undertaking research in disease
scaling up and their roles	management
	• KEPHIS to ensure the quality of seedlings is maintained
	• PCPB to promote registration of fungicides for management
	of the disease and regulate the use of pesticides
	• Farmers/farmer groups to adopt these technologies
	• County governments, central governments develop enabling
	Financial institutions to provide credit facilitators
	<ul> <li>Private pesticide companies to promote and sell registered</li> </ul>
	pesticides
C: Current situation and futu	re scaling up
Counties where already	-
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	• Limited knowledge by farmers on integrated disease
	management
	<ul> <li>Limited number of extension staff</li> <li>Limited groop grow inpovetion pletforms to facilitate</li> </ul>
	interaction of farmers with relevant stakeholders.
	• Farmers may not implement some of the practices e.g. Crop
	rotation small farms and limited economic resources.
Suggestions for addressing	• Disseminate and promote integrated disease management
the challenges	practices and safe use of pesticides
	• Establish spray teams/champions
	• Support extension services
	• Training on integrated disease management practices (use of
	tolerant varieties and use of ITK's) in managing the disease
Lessons learned in up scaling	• Successful scaling up is possible if diverse value chain
if any	stakeholders collaborate in an innovation platform
	1

	<ul> <li>Adoption of good agricultural practices by the producers is key in management of the diseases</li> <li>More than one approach is used in management of major diseases</li> <li>IDM is environment friendly and the chemical component should be used as the last resort</li> <li>Participatory, farmer-centered approaches, which encourage farmers to participate in the innovation process and the facilitation of experimentation among farmer communities in the evaluation of the technology enhances technology adoption</li> <li>IDM approaches are knowledge intensive and location-specific, farmers would need to understand the agroecological processes affecting the disease to be able to make informed decisions on how to manage the diseases once they become a problem.</li> </ul>
and market conditions	• Regulatory bodies e.g. PCPBP, KBS to ensure fungicides sold to farmers are genuine and of high quality.
necessary for development	• Farmers' willingness to adopt the disease management
and up scaling	• Farmers are organized in groups to ensure that management
	practices are effectively up-scaled
	• Farm input costs are within the reach of farmers.
	• Understanding the physical and biotic environment in target
	ecologies; understanding community culture, preferences,
	and practices
	• Training on IDM to increase awareness of IDM and reduce
	possible negative impact on the environment resulting from
	Market able to abooth increased supply of grain
D. Economic gender vulners	ble and marginalized groups (VMCs) considerations
Basic costs	23.000/=
Estimated returns	If the farmer doesn't apply the TIMP yield will be reduced by
	21% ( <b>15,120</b> /=). Therefore, the estimated returns will be
	72 000-15 120= 56 880/=
Gender issues and concerns in	Women and youth have limited access to productive
development. dissemination	resources such as land, credit, and quality seeds than men
adoption and scaling up	• Women and youth have limited access to education, training
	and extension services than men
	• Women have limited access to agro-vets as they sometimes
	cannot travel to far markets due to their domestic roles

	• Women have less access to agricultural information, technology and knowledge
	<ul> <li>Women might have limited knowledge on integrated management of powdery mildew</li> </ul>
Gender related opportunities	• Opportunities for youths exists in spraying the crop
	<ul> <li>Increased production leading to stable markets for green gram</li> </ul>
VMG issues and concerns in	• VMGs have limited access to productive resources such as
development, dissemination	land, credit, and quality seeds
adoption and scaling up	services
	• VMGs have limited access agro-vets as they sometimes cannot travel to far regional markets due to either their
	sickness, disability or lack of exposure
	decision making in development and dissemination activities
	• VMGs have limited access to seed and information on new
	varieties and production techniques
VMG related opportunities	• There is low adoption by VMGs due to lack of awareness The technology can improve food and nutrition security and a
, into remove opportunities	window for increased income.

2.6.4 TIMP name	Integrated Management of Cercospora leaf spot disease of
	green grams
Category (i.e. technology, innovation or management practice)	Management practice
A: Description of the technology	ogy, innovation or management practice
Problem to be addressed	Yield loss of up to 95% due to infection of green gram by the disease
What is it? (TIMP description)	<ul> <li>Integrated disease management for Cercospora leaf spot comprises of the use of cultural management practices, deployment of tolerant varieties and chemical control in the management of the disease in green gram.</li> <li>Cultural practices: <ul> <li>Practice good field sanitation and hygiene practices by collecting and safely disposing infected plants.</li> <li>Regular weeding</li> </ul> </li> </ul>
	<ul> <li>Grow tolerant varieties:</li> <li>Grow varieties that are less susceptible to the disease such as LGG-460.</li> <li>Chemical management:</li> <li>Spray Mancozeb 2kg/ha or Carbendazim 500 g/ha.</li> </ul>
	Fowdery mildew (Erysiphe polygoni) (Source; Daniel Mutisya KALRO)
Justification	Integrated Disease Management enables the alleviation of yield loss due to green gram damage by Cercospora leaf spot disease which is a major challenge in green gram production in Kenya.
B: Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Producers, Exporters, Farmers, Processors, Extension service providers, Researchers, Academia
Approaches to be used in dissemination	<ul> <li>On farm and on station research trails and demonstrations</li> <li>Training workshops, seminars, meetings</li> <li>Field days</li> </ul>

	Agricultural shows
	• Farmer research networks

2.6.5 TIMP name	Integrated Management of Yellow Mosaic disease of green
	grams
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technolo	bgy, innovation or management practice
Problem addressed	Yield loss due to infection of green gram by the disease
What is it? (TIMP	Integrated management of Yellow Mosaic disease of green grams
description)	consists of various approaches that help to break the disease cycle.
	They include cultural management and chemical control. Yellow
	Mosaic disease of green grams is associated with insect
	infestations that transmit the pathogen while sacking sap from
	plant tissues. The disease is effectively managed by controlling
	insect infestations
	Cultural practices:
	• Use of certified seed
	• Monitoring insect vectors that transmit the viruses
	<ul> <li>Avoiding work on fields when wet to prevent spread</li> </ul>
	• Uprooting weeds that could serve as alternative hosts
	• Increase the seed rate (25 kg/ha).
	Use of resistant varieties
	• Grow resistant green gram variety like Pant Moong-3,
	Pusa Vishal, Basanti, ML-5, ML337, PDM-54 and Samrat
	Chemical management:
	• Treat the seeds with Thiomethoxam-70WS or
	Imidacloprid-70WS @4g/kg • Spray Thiamethoxam-
	25WG @ 100g or Imidacloprid 17.8% SL @ 100 ml in
	500 lit of water.

	Get other control products from the PCPB (www.pcpb.or.ke) list of registered pest control products, and use them according to the manufacturer's instructions.
	Yellow Mosaic disease of green grams (Source; Green gram farming.
	www.apnikheti.com)
Justification	Integrated Disease Management is an environmental friendly
	approach that enables the control of the disease through control of
	vectors and cultural practises that prevent on farm spread hence
	reducing yield loss.
B: Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Producers, Exporters, Researchers, Academia, Farmers
Approaches to be used in	• On farm and on station research trails and demonstrations
dissemination	• Training workshops, seminars, meetings
	• Field days
	Agricultural shows
	MoA/Extension officers
	• Farmer research networks
	• Farmer to farmer

2.6.7 TIMP name	Integrated Management of bacterial leaf blight disease of
	green grams
Category (i.e. technology, innovation or management practice)	Management practice
A: Description of the technolo	bgy, innovation or management practice
Problem addressed	Yield loss due to infection of green gram by the disease
What is it? (TIMP	Integrated management of Bacterial leaf blight comprises the use
description)	of cultural management practices and chemical control in its management.
	Cultural practices:
	<ul> <li>Crop rotation with non-legumes for a period of 2 to 3 seasons</li> <li>Rogueing out infected plants from the farm and burying then deeply.</li> <li>Avoidance of working in the fields when plants are wet to minimize spread.</li> <li>Disinfecting farm tools in jik solution (50 ml: litre).</li> </ul>
	• Practicing good field sanitation and hygiene practices by collecting and disposing infected plants.
	Chemical management:
	<ul> <li>To suppress the disease, spray copper oxychloride (cuprocaffaro micro 37.5 at a rate of 50gm/20litres water or Isacop 50WP at a rate of 60g/20litres of water)</li> <li>Get other control products from the PCPB (www.pcpb.or.ke) list of registered pest control products, and use them according to the manufacturer's instructions.</li> </ul>
	Bacterial leaf blight of green grams Source: Courtesy of EcoPort.
	J.W. Sheppard ( <u>http://www.ecoport.org</u>

Justification	Bacterial leaf blight disease is a major challenge in green gram
	production in Kenya, occurring in all major production areas, but
	being more severe in some regions. It causes significant yield loss
	because it causes death of tissues, hence limiting the ability of the
	plant to photosynthesize. Integrated Disease Management is an
	environmental friendly approach that enables the control of the
	disease and cultural practises that prevent on farm spread hence
	reducing vield loss.
B: Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Producers, Exporters, Farmers, Processors, Extension service
	providers, Researchers, Academia
Approaches to be used in	• On farm and on station research trails and demonstrations
dissemination	Training workshops, Seminars, Meetings

Critical/essential factors for	Agricultural innovation platforms     Strong partnership linkages
successful promotion	<ul> <li>Need for former involvement helps generate locally specific</li> </ul>
successful promotion	• Need for farmer involvement helps generate locally specific taskeigues and solutions witchle for their particular forming
	techniques and solutions suitable for their particular farming
	systems and integrating control components that are
	ecologically sound and readily available to them e.g. Use of
	Indigenous Traditional Knowledge (ITK) can be promoted
	and adopted faster.
	• Accessibility and cost of the practice by farmers: low-cost
	agricultural practices are easily promoted and accepted
Partners/stakeholders for	• KALRO to continually undertake research in disease
scaling up and their roles	management
	• KEPHIS to ensure seedling quality is maintained
	<ul> <li>PCPB to promote registration of fungicides for disease management</li> </ul>
	• Farmers/farmer groups to adopt the technologies
	• County governments, central governments for development of
	enabling policies and create awareness.
	Financial institutions to provide credit facilitators
C: Current situation and futu	re scaling up

Counties where already	-
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	Farmers may not implement some of the practices e.g. Crop
	rotation small farms and limited economic resources.
Suggestions for addressing	Training on integrated disease management practices (use of
the challenges	clean seed, field sanitation, crop rotation, biological control,
	tolerant varieties and use of ITK's) in managing the disease.
Lessons learned in up scaling,	• More than one approach is used in management of major
if any	diseases
	• IDM is environment friendly and the synthetic chemical component should be used as the last resort
	• Participatory, farmer-centered approaches, which encourage
	farmers to participate in the innovation process and the
	facilitation of experimentation among farmer communities in
	the evaluation of the technology enhances technology
	adoption
	• IDM approaches are knowledge intensive and location-
	specific, farmers would need to understand the agro-
	ecological processes affecting the disease to be able to make
	informed decisions on how to manage crop to avoid disease
	occurrence, as well as how to manage the diseases once they
	become a problem. This will require a capacity building on
	crop monitoring and ecological principles.
Social, environmental, policy	• Understanding the physical and biotic environment in target
and market conditions	ecologies; understanding community culture, preferences,
necessary for development	and practices
and up scaling	• Training on IDM to increase awareness of IDM and reduce
	possible negative impact on the environment resulting from
	wrong application of IDM
	• Market able to absorb increased supply of grain
D: Economic, gender, vulnera	able and marginalized groups (VMGs) considerations
Basic costs	19,000/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by
	40% (28,800/=). Therefore, the estimated returns will be
	72,000-28,800= 43,200/=

Gender issues and concerns in	• Women and youth have limited access to productive
development, dissemination	resources such as land, credit, and quality seeds than men
adoption and scaling up	• Women and youth have limited access to education, training
	and extension services than men
	• Women have limited access to agro-vets as they sometimes
	cannot travel to far markets due to their domestic roles
	• Women have less access to agricultural information,
	technology and knowledge
	• Women might have limited knowledge on integrated
	management of green gram bacterial leaf blight.
Gender related opportunities	• Opportunities for youth employment in implementing IDM
	protocols
	Opportunities in marketing pesticides
VMG issues and concerns in	• VMGs have limited access to productive resources such as
development, dissemination	land, credit, and quality seeds
adoption and scaling up	• VMGs have limited access to training and extension services
	• VMGs have limited access agro-vets as they sometimes
	cannot travel to far regional markets due to either their
	sickness, disability or lack of exposure
	• Due to their social status VMGs are often excluded from
	decision making in development and dissemination activities
	• VMGs have limited access to seed and information on new
	varieties and production techniques
	• There is low adoption by VMGs due to lack of awareness
VMG related opportunities	The technology can improve food and nutrition security and a
	window for increased income.

- 2. Explore the use of ITKs in disease management

2.6.8 TIMP name	Integrated Management of root rot disease of green grams	
Category (i.e. technology,	Management practice	
innovation or management		
practice)		
A: Description of the technology, innovation or management practice		
Problem addressed	Yield loss due to disease	
What is it? (TIMP description)	<ul> <li>Integrated sooty mold management consists of various approaches that help to break the disease cycle. They cultural management and chemical control. Sooty mold is associated with insect infestations that excreta sugary excreta which provides sugars for fungal growth on the plant. Disease is effectively managed by controlling insect infestations</li> <li><b>Cultural practices:</b></li> <li>Crop rotation with non-legumes for 6-8 seasons</li> <li>Practising field hygiene.</li> <li>Avoid surface run off as it spreads the pathogen to non-infected areas</li> <li>Uprooting inffected plants and burying deeply to reduce inoculum</li> <li>Disinfecting farm tools in jik solution (50 ml : litre) to prevent spread.</li> <li>Apply farm yard manure or green leaf manure (Gliricidia maculate) at 10 t/ha</li> </ul>	
	Biological management:	
	Applying rootgard, Trianum P and Trichotech	
	Chemical management	

	• Treat the seeds with Carbendazim + Thiram at 2 g/kg or
	pellet the seeds with Trichoderma viride at 4 g/kg or
	Pseudonomas fluorescens @ 10g/kg of seed.
	• Applying neem cake at 150 kg/ha.
	• Get other control products from the PCPB
	(www.pcpb.or.ke) list of registered pest control products, and use them according to the manufacturer's instructions
Instification	Dry rot disease is a major challenge in green gram production in
Justification	Kenva occurring in all major production areas, but being more
	severe in some regions based on practices undertaken. Esilure to
	severe in some regions based on practices undertaken. Fandre to
	observe crop rotation would lead to higher sevenity cases and
	spread of the disease. It causes significant yield loss because it
	blocks the vascular system of the plant preventing water and
	nutrient uptake. Integrated Disease Management is an
	environmental friendly approach that enables the control of the
	disease through recommended cultural practises, use of
	biopesticides and synthetic pesticides where high severity is
	observed.
<b>B:</b> Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Producers, Exporters, Researchers, Academia, Farmers
Approaches to be used in	• On farm and on station research trails and demonstrations
dissemination	<ul> <li>Training workshops, Seminars, Meetings</li> </ul>
	• Field days
	Agricultural shows
	MoA/Extension officers
	• Farmer research networks
	• Farmer to farmer
	• Mass media – Agricultural programs
	<ul> <li>Promotional materials (posters/brochures/leaflets, manuals)</li> <li>Web materials</li> </ul>
	Digital platforms
	• Farmer Field and Business Schools (FFBS)
	Agricultural innovation platforms
Critical/essential factors for	• Carry out applied and adaptive research to validate and release
successful promotion	improved green gram varieties
	• Create a platform for interaction of green gram value chain stakeholders
	• Farmers adopt appropriate agronomic practices
	Form well organized farmer groups and networks
Partners/stakeholders for	• KALRO to continually undertake research in disease
scaling up and their roles	management
	• KEPHIS to ensure seedling quality is maintained
	<ul> <li>PCPB to promote registration of fungicides for disease management</li> </ul>
	• Farmers/farmer groups to adopt the technologies
	• County governments, central governments for development
--------------------------------	--------------------------------------------------------------------------------------------------------------------------------
	• Financial institutions to provide credit facilitators
C: Current situation and futu	re scaling up
Counties where already	
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Tayeta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	• Limited knowledge by farmers on integrated disease
	management
	Limited number of extension agents
	• Lack of green gram innovation platforms to facilitate interaction of farmers with relevant stakeholders
	• Farmers may not implement some of the practices e.g. Crop rotation small farms and limited economic resources.
Suggestions for addressing	• Limited knowledge by farmers on integrated disease
the challenges	management
	• Limited number of Extension agents
	• Lack of green gram innovation platforms to facilitate interaction of farmers with relevant stakeholders
	• Training on integrated disease management practices (use of clean seed, field sanitation, crop rotation, biological control,
	tolerant varieties and use of ITK's) in managing the disease.
Lessons learned in up scaling,	• Establish green gram innovation platforms
if any	• Partnership is important in technology dissemination and adoption and this can be facilitated through innovation platforms
	• Adoption of good agricultural practices by the producers is
	key in management of the diseases
	• More than one approach is used in management of major
	diseases
	• IDM is environment friendly and the synthetic chemical
	component should be used as the last resort
	• Participatory, farmer-centered approaches, which encourage
	farmers to participate in the innovation process and the
	facilitation of experimentation among farmer communities in
	the evaluation of the technology enhances technology
	adoption
	• IDM approaches are knowledge intensive and location-
	specific, farmers would need to understand the agro-
	ecological processes affecting the disease to be able to make
	informed decisions on how to manage crop to avoid disease
	occurrence, as well as how to manage the diseases once they

	become a problem. This will require a capacity building on
	crop monitoring and ecological principles.
Social, environmental, policy	• Understanding the physical and biotic environment in target
and market conditions	ecologies; understanding community culture, preferences,
necessary for development	and practices
and up scaling	• Training on IDM to increase awareness and reduce possible
	negative impact on the environment resulting from wrong
	application
	• Market able to absorb increased supply of grain
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	30,000/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by
	60%. Therefore, the estimated returns will be
	72 000-43 200= 28 800/=
Gender issues and concerns in	• Women and youth have limited access to productive resources
development dissemination	such as land, credit, and quality seeds than men
adoption and scaling up	• Women and youth have limited access to education, training
adoption and scaling up	and extension services than men
	• Women have limited access to agro-vets as they sometimes
	cannot travel to far markets due to their domestic roles
	• Women have less access to agricultural information,
	technology and knowledge
	• Women might have limited knowledge on integrated
	management of dry rot
Gender related opportunities	• Opportunities for youth employment in implementing IDM
	protocols
	Opportunities in marketing pesticides
VMG issues and concerns in	The management practices reduce the production costs therefore
development, dissemination	VMG's can afford to produce green grams
adoption and scaling up	
VMG related opportunities	The technology can improve food and nutrition security and a
	window for increased income.

1. Explore the use of Trichoderma based products for biological control of the pathogen

2.6.9 TIMP name	Integrated Management of scab disease of green grams
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology	ogy, innovation or management practice
Problem addressed	Yield loss due to disease
What is it? (TIMP	Integrated management of scab comprises of the use of cultural
description)	management practices and chemical control options in its
	management
	Cultural practices:
	• Practice good field sanitation and hygiene practices by collecting and disposing infected plants
	• Regular weeding and proper application of agronomic practices
	Chemical management [.]
	• Apply fungicides from flower-bud formation stage until when pods are half-grown. Fungicides that are effective are Copper based fungicides e.g. Demildex WP, Trifloxystrobin + Tebuconazole based fungicides e.g

	Nativo 300 SC and Carbendazim based fungicides e.g. Rodazim SC
Justification	Green gram scab disease may cause significant yield losses if not well managed. The scarred tissues cause physical damage on the pods making it unappealing for the market. In addition, the scared tissue may become entry point of other pathogens leading to pod rots. This causes reduced returns for the farmers and negatively impacts on food and national security of the country.
B: Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Producers, Exporters, Farmers, Processors, Extension service
Approaches to be used in dissemination	<ul> <li>Providers, Researchers, Academia</li> <li>On farm and on station research trails and demonstrations</li> <li>Training workshops, Seminars, Meetings</li> <li>Field days</li> <li>Agricultural shows</li> <li>Farmer research networks</li> <li>Farmer to farmer</li> <li>Mass media - Agricultural programs</li> </ul>
	<ul> <li>Mass media – Agricultural programs</li> <li>Promotional materials (posters/brochures/leaflets, manuals)</li> <li>Web materials</li> <li>Digital platforms</li> <li>Farmer Field and Business Schools (FFBS)</li> <li>Agricultural innovation platforms</li> </ul>
Critical/essential factors for successful promotion	<ul> <li>Carry out Applied and adaptive research to validate and release improved green gram varieties</li> <li>Create a platform for interaction of green gram value chain stakeholders</li> </ul>

	<ul> <li>Farmers adopt appropriate agronomic practices</li> <li>Form well organized farmer groups and networks</li> </ul>
Partners/stakeholders for	KALRO to continually undertake research in disease management
scaling up and their roles	KEPHIS to ensure seedling quality is maintained
scaling up and then roles	PCPB to promote registration of fungicides for disease
	management
	Farmers/farmer groups to adopt the technologies
	County governments, central governments for development of
	enabling policies and create awareness.
	Financial institutions to provide credit facilitators
C: Current situation and futu	re scaling up
Counties where already	-
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	• Limited knowledge by farmers on integrated disease
	management
	• Few farmer group organizations
	• Lack of green gram innovation platforms to facilitate
	interaction of farmers with relevant stakeholders
Suggestions for addressing	• Establish green gram innovation platforms
the challenges	• Hold mass campaigns to create awareness on integrated pest
	management practices and safe use of pesticides
Lessons learned in up scaling,	• Establish green gram innovation platforms
if any	• Foster more Partnership in technology dissemination and
	adoption through innovation platforms
	• Adoption of good agricultural practices by the farmers in management of diseases
Social, environmental, policy	- Understanding the physical and biotic environment in target
and market conditions	ecologies; understanding community culture, preferences,
necessary for development	and practices
and up scaling	- Training on IDM to increase awareness of IDM and reduce
	possible negative impact on the environment resulting from
	wrong application of IDM
	- Market able to absorb increased supply of grain
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	23,000/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by
	21%. Therefore, the estimated returns will be
	72,000-15,120= 56,880/=

Gender issues and concerns in development, dissemination adoption and scaling up Gender related opportunities	<ul> <li>The management practices reduce the production costs and therefore women and youth can afford to produce green grams</li> <li>IDM protocols will not overburden any gender in implementation and therefore have potential for adoption by both gender.</li> <li>Setting of traps may create income generation opportunity for the youth</li> <li>Opportunities for youth employment in implementing IDM protocols</li> </ul>
	- Opportunities in marketing pest traps
VMG issues and concerns in development, dissemination adoption and scaling up	The management practices reduce the production costs therefore VMG's can afford to produce green grams
VMG related opportunities	The technology can improve food and nutrition security and a window for increased income.

# 2.7 Green Gram Pests

Integrated Management of Root Knot nematodes in green
grams
Management practice
gy, innovation or management practice
Yield losses of up to 25.6% due to root knot nematodes
Root knot nematodes affecting green grams are controlled through cultural management practises and chemical control;
<ul> <li>Cultural practices</li> <li>Crop rotation with non-leguminous crops i.e. crops in the grass family for 4-6 seasons.</li> <li>Avoidance of surface run off as it spreads the pest to non-infected areas, uprooting affected plants and burying.</li> <li>Soil solarization during dry months of the year on severely affected fields.</li> <li>Cleaning of farm tools and equipment's after use</li> <li>Incorporate Tithonia or Mexican marigold as green manure into the infested soil during planting</li> </ul> Biological control <ul> <li>Drench infested soil with neem based products e.g. Nimbecidine at a rate of 60ml/20L</li> </ul> Chemical management <ul> <li>Drench with <i>Trichoderma</i> spp based biopesticides in the rooting media.e.g.Trianum P at a rate of 45g/15L of water</li> </ul> For knot nematole <i>Motional Control Plants are provided as a specific provided as a provided as a specific provided as a provide</i>

Justification	Nematodes cause considerable reduction in yield and lower the
	grain quality of green grams. Where the nematode is severe and
	not controlled plants become greatly reduced in size and yield.
	Losses of above 20-60% are experienced due to the pest under
	high infestation levels. Marketing of such produce that is severely
	affected poses challenges and fetches low prices or is rejected.
	Integrated Management of pests considering food safety concerns
	should be highly advocated considering that the grain consumed
	very widely in Kenya. This involves the use of a combination of
	cultural and bio-control and biopesticides that are relatively safe.
	Soft synthetic pesticides are recommended as a last option. This
	minimizes overuse of synthetic pesticides. Adoption of an IPM
	approach would enhance food safety among the consumers and
	also contribute to environmental safety.
B: Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Farmers, Exporters, Processors, Extension service providers,
	Researchers, Academia
Approaches to be used in	• On farm and on station research trails and demonstrations
dissemination	<ul> <li>Training workshops, seminars, meetings</li> </ul>
	• Field days
	Agricultural shows
	Farmer research networks
	• Farmer to farmer
	Mass media – Agricultural programs
	• Promotional materials (posters/brochures/leaflets, manuals)
	<ul> <li>Digital platforms</li> <li>Earmor Field and Puginoss Schools (FEPS)</li> </ul>
	<ul> <li>Farmer Field and Business Schools (FFBS)</li> <li>A gricultural innovation platforms</li> </ul>
Critical/essential factors for	Strong partnership linkages with green gram stakeholders
successful promotion	• Undertake applied and adaptive research to validate and
	release improved green gram varieties
	• Create a platform for interaction of green gram value chain
	stakeholders
	• Farmers adopt appropriate agronomic practices have well
	organized farmer groups and networks e.g. Use of
	and adopted faster
	<ul> <li>Accessibility and cost of the practice by farmers: low-cost</li> </ul>
	agricultural practices are easily promoted and accepted
Partners/stakeholders for	• KAIRO to continue undertaking research in disease
scaling up and their roles	• KALKO to continue undertaking research in disease
seaming up and then roles	• KEPHIS to ensure the quality of seedlings is maintained
	• Farmers/Farmer Groups to adopt these technologies
	• County governments, central governments develop
	enabling policies and create awareness.

	• Financial institutions to provide credit facilitators
	• Private pesticide companies to promote and sell registered
	pesticides
C: Current situation and futu	re scaling up
Counties where already	-
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	Unwillingness of farmers to adopt IPM technologies
	• In adequate knowledge on IPM strategies on insect pests
	infesting green gram and losses attributed to them
	• Poor linkages among stakeholders in green gram value chain
Suggestions for addressing	• PCPB enhance registration of crop protection products
the challenges	• Training of stakeholders in IPM options
	• Establish green gram innovation platforms for technology
	disseminations
	• Dissemination of integrated pest management practices
	and safe use of pesticides
	• Promote appropriate marketing channels e.g. contract farming collective production and marketing
Lessons learned in up scaling.	Sensitization is necessary for people to appreciate the use
if any	of IPM in insect management
ii uiiy	• Adoption of good agricultural practices by farmers is
	key in management of the insects
	• Chances of successful scaling are higher when many
	value chain stakeholders collaborate in an innovation
	platform
	• Partnership is important in technology dissemination
	and adoption and this can be facilitated through
	innovation platforms
Social, environmental, policy	Eavorable environmental conditions
and market conditions	Willingness of stakeholders to participate
necessary for development	Favorable environmental conditions
and up scaling	• Regulatory bodies e.g. PCPBP, KBS to ensure insecticides
	sold to farmers are genuine and of high quality
	• Producers willing to adopt the insect management
	practices
	• Froducers are organized in groups to ensure that management practices are effectively up scaled
	<ul> <li>Farm input costs are within the reach of farmers</li> </ul>
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	37,000/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by
	25.6% (18,432/=). Therefore, the estimated returns will be
	· · · · · · · · · · · · · · · · · · ·

	72,000 - 18,432 = 53,568/=
Gender issues and concerns in development, dissemination adoption and scaling up Gender related opportunities	<ul> <li>Women and youth have limited access to productive resources such as credit</li> <li>Women and youth have limited access to pest management training and extension services</li> <li>Due to their social status women and youth are often excluded from decision making in development and dissemination activities</li> <li>Youth applying synthetic pesticides should always wear Personal Protective Equipment (PPE)</li> <li>Young male and female youth may be employed to monitor (pest scouting)</li> </ul>
	• Spraying of the crop will create employment opportunities for young male youths
VMG issues and concerns in development, dissemination adoption and scaling up	<ul> <li>VMGs have limited access to productive resources such as credit and pest control products</li> <li>VMGs have limited access to training and extension services</li> <li>Due to their social status VMGs are often excluded from decision making in development and dissemination activities</li> <li>VMGs have limited access to pest management information</li> <li>There is low adoption by VMGs due lack of awareness</li> <li>VMG may have a challenge in utilization of spraying equipment</li> </ul>
VMG related opportunities	• Opportunities for unemployed rehabilitated male youths exist in pest scouting and cotton spraying programmes

2.7.2 TIMP name	Integrated Management of White flies (Bemisia tabaci)
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the techno	ology, innovation or management practice
Problem addressed	The whitefly causes up to 85% yield loss.
What is it? (TIMP	Timely application of integrated management options is required.
description)	The following cultural and chemical strategies are involved:
	<ul> <li>Cultural practises;</li> <li>Ploughing in previous crop residue in the soil</li> <li>Intercropping with non-host crop i.e. onion, garlic</li> <li>Chemical management <ul> <li>Limited chemical use pesticides will conserve black ants that are predators and feed on nymphal stages of the whiteflies</li> <li>Use of yellow sticky traps at the rate of 10-12 traps/ha to trap</li> <li>Neem-based derivative products such as Nimbecidine, Achook, Neemark that do not contaminate the environment</li> </ul> </li> <li>Wite flies, Bemisia tabaci (Genn.)</li> </ul>

Justification	White flies cause considerable reduction in yield and lower the grain quality of green grams. Where the white fly is severe and not controlled plants become greatly reduced in size and yield. Losses of above 20-85% are experienced due to the pest under high infestation levels. Marketing of such produce that is severely affected poses challenges and fetches low prices or is rejected. Integrated Management of pests considering food safety concerns should be highly advocated considering that the grain consumed very widely in Kenya. This involves the use of a combination of cultural and bio-control and biopesticides that are relatively safe. Soft synthetic pesticides are recommended as a last option. This minimizes overuse of synthetic pesticides. Adoption of an IPM approach would enhance food safety among the consumers and also
	contribute to environmental safety.
B: Assessment of dissemina	tion and scaling up/out approaches
Users of TIMP	Farmers, Exporters, Extension service providers, Researchers, Academia

Critical/essential factors for successful promotion	<ul> <li>KALRO to continua undertaking research on use of IPM in management of white flies</li> <li>PCPB to promote registration of sticky pheromone traps for management of the insect and regulate their use</li> <li>Farmers/farmer groups to adopt these technologies</li> <li>County governments, central governments develop enabling policies and create awareness on IPM.</li> <li>Financial institutions to provide credit facilities</li> <li>Private pesticide companies to promote and sell registered pesticides only</li> </ul>
scaling up and their roles	Academia

C: Current situation and future scaling up	
Counties where already promoted, if any	None at present.
Counties where TIMPs will be up scaled	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot, Baringo, Tana River
Challenges in dissemination	<ul> <li>Unwillingness of farmers to adopt IPM technologies</li> <li>In adequate knowledge on IPM strategies on insect pests infesting green gram and losses attributed to them</li> <li>Poor linkages among stakeholders in green gram value chain</li> <li>PCPR enhance registration of eron protection products</li> </ul>
the challenges	<ul> <li>PCPB enhance registration of crop protection products</li> <li>Training of stakeholders in IPM options</li> <li>Establish green gram innovation platforms for technology disseminations</li> <li>Dissemination of integrated pest management practices and safe use of pesticides</li> <li>Promote appropriate marketing channels e.g. contract farming, collective production and marketing</li> </ul>
Lessons learned in up scaling, if any	<ul> <li>Sensitization is necessary for people to appreciate the use of IPM in insect management</li> <li>Adoption of good agricultural practices by farmers is key in management of the insects</li> <li>Chances of successful scaling are higher when many value chain stakeholders collaborate in an innovation platform</li> <li>Partnership is important in technology dissemination and adoption and this can be facilitated through innovation platforms</li> </ul>
Social, environmental, policy and market. Conditions necessary for development and up scaling	<ul> <li>Favorable environmental conditions</li> <li>Willingness of stakeholders to participate</li> <li>Favorable environmental conditions</li> <li>Regulatory bodies e.g. PCPBP, KBS to ensure insecticides sold to farmers are genuine and of high quality</li> <li>Producers willing to adopt the insect management practices</li> <li>Producers are organized in groups to ensure that management practices are effectively up-scaled</li> <li>Farm input costs are within the reach of farmers</li> </ul>
D: Economic, gender, vulnerable and marginalized groups (VMGs) considerations.	
Basic costs	28,600/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by 85% (61,200/=). Therefore, the estimated returns will be 72,000-61,200= 10,800/=

Gender, issues and concerns in development, dissemination adoption and up scaling	<ul> <li>Women and youth have limited access to productive resources such as land and credit than men to purchase inputs such as pesticides</li> <li>Women and youth have limited access to education, training and extension services than men</li> <li>Men dominant most decisions at the household and community levels including pest control</li> <li>Women have limited access to markets as they sometimes cannot travel to far markets outlets to source for green grams inputs</li> </ul>
Gender related opportunities	<ul> <li>Opportunities for youths exists in spraying the crop</li> <li>Increased production of the crop leading to increased incomes</li> </ul>
VMGs issues and concerns in development, adoption and scaling up.	<ul> <li>VMGs have limited access to productive resources such as land, credit, and quality seeds</li> <li>VMGs have limited access to training and extension services</li> <li>VMGs have limited access to markets as they sometimes cannot travel to far regional markets due to either their sickness, disability or lack of exposure</li> <li>Due to their social status VMGs are often excluded from decision making in development and dissemination activities</li> <li>VMGs have limited access to green gram thrips information and their management strategies</li> <li>There is low adoption by VMGs due lack of awareness</li> </ul>
VMG related opportunities	• Opportunities for unemployed youths and those recovering from drugs exists in spraying the crop

- Capacity building on white fly identification and management
- Validation of biopesticides and synthetic pesticides in the management of white fly
- Determine the effects of white fly on the yield, quality and implication on economic returns for the farmer

2.7.3 TIMP name	Integrated Management of Flea beetles
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the techno	ology, innovation or management practice
Problem addressed	The flea beetles feed on both the leaves and young pods causing leaf windowing leading to 15% yield loss
What is it? (TIMP	Integrated Flea beetle management consists of;
description)	<ul> <li>Cultural control</li> <li>Preventive control measures are sanitation by removal of plants and all debris as soon as harvesting is over.</li> <li>Hand pick and destroy the beettles at the beginning of infestation as this will help to reduce the population density</li> <li>Remove alternative host near the crop</li> <li>Biological control <ul> <li>Use natural enemies such as domestic chicken and allow perching birds to prey on beetles</li> </ul> </li> </ul>
	<ul> <li>Use biopesticides such as Nimbecidine EC (Azadirachtin 0.03%).</li> <li>Chemical control</li> </ul>

	Use only pest control products recommended by Pest Control Products Board (PCPB) such as:
	<ul> <li>Bulldock star EC 262.5 (<i>Beta-cyfluthrin 12.5 g/L</i></li> </ul>
	+Chlorpyrifos 250 g/L)
	• Tata-alpha 10 EC ( <i>Alpha-cypermethrin</i> (10 g/L)
	• Decis 2.5 EC ( <i>Deltamethrin25g/L</i> )
	• Duduthrin 1.75 EC (Lambdacyhalothrin 17.5 g/L)
	Synthetic pesticides should be used as the last option since most
	of them are detrimental to the environment
T ('C' )'	Striped flea beetle, <i>Phylotreta striolata</i>
Justification	Beetles cause considerable reduction in yield and lower the grain
	controlled plants become greatly reduced in size and yield Losses
	of above 20-60% are experienced due to the pest under high
	infestation levels. Marketing of such produce that is severely
	affected poses challenges and fetches low prices or is rejected.
	Integrated Management of pests considering food safety concerns
	should be highly advocated considering that the grain consumed
	very widely in Kenya. This involves the use of a combination of
	cultural and bio-control and biopesticides that are relatively safe.
	Soft synthetic pesticides are recommended as a last option. This
	minimizes overuse of synthetic pesticides. Adoption of an IPM
	approach would enhance food safety among the consumers and also
	contribute to environmental safety.
<b>B:</b> Assessment of dissemina	tion and scaling up/out approaches
Users of TIMP	Producers, Exporters, Researchers, Academia, Farmers
Approaches to be used in	• On farm and on station research trails and demonstrations
dissemination	Training workshops, Seminars, Meetings
	• Field days
	Agricultural shows
	MoA/Extension officers
	• Farmer research networks
	• Farmer to farmer
	• Mass media – Agricultural programs
	• Promotional materials (posters/brochures/leaflets, manuals)
	• Web material's

	Digital platforms
	• Farmer field and business schools (FFBS)
	Agricultural innovation platforms
Critical/accontial factors for	• Formore adort annuarrista agronomia prostigas
critical/essential factors for	<ul> <li>Farmers adopt appropriate agronomic practices</li> <li>Form well organized former groups and networks</li> </ul>
successful promotion	• Form wen organized farmer groups and networks
Partners/stakeholders for	• KALRO to continually undertake research in disease
scaling up and their roles	management
	• KEPHIS to ensure seedling quality is maintained
	• PCPB to promote registration of fungicides for disease management
	• Farmers/farmer groups to adopt the technologies
	• County governments, central governments for development of
	enabling policies and create awareness
	Financial institutions to provide credit facilitators
C: Current situation and fu	ture scaling up
Counties where already	None at present.
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be up scaled	Baringo, Tana River
Challenges in dissemination	<ul> <li>Unwillingness of farmers to adopt IPM technologies</li> <li>In adequate knowledge on IPM strategies on insect pests infesting green gram and losses attributed to them</li> <li>Poor linkages among stakeholders in green gram value chain</li> </ul>
Suggestions for addressing	PCPB enhance registration of crop protection products
the challenges	• Training of stakeholders in IPM options
	• Establish green gram innovation platforms for technology disseminations
	• Dissemination of integrated pest management practices and safe use of pesticides
	• Promote appropriate marketing channels e.g. contract farming, collective production and marketing
Lessons learned in up	• Sensitization is necessary for people to appreciate the use
scaling, if any	of IPM in insect management
	• Adoption of good agricultural practices by farmers is key in management of the insects
	• Chances of successful scaling are higher when many value chain stakeholders collaborate in an innovation platform
	• Partnership is important in technology dissemination and adoption and this can be facilitated through innovation platforms

Social, environmental,	Favorable environmental conditions
policy and market	Willingness of stakeholders to participate
conditions necessary	Favorable environmental conditions
5	• Regulatory bodies e.g. PCPBP, KBS to ensure
	insecticides sold to farmers are genuine and of high
	quality
	• Producers willing to adopt the insect management
	practices
	• Producers are organized in groups to ensure that
	management practices are effectively up-scaled
	• Farm input costs are within the reach of farmers
D: Economic, gender, vulne	rable and marginalized groups (VMGs) considerations.
Basic costs	33,000/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by
	15% (10,800/=). Therefore, the estimated returns will be
	72 000 10 800- 61 200/-
Gender issues and concerns	• Women and youth have limited access to productive
in development	resources such as land credit and quality seeds than
disconsignation adaption and	men
dissemination adoption and	• Women and youth have limited access to education.
up scaling	training and extension services than men
	• Women have limited access to information relating to
	management of stripped flea bettles
	• Women experience financial constraints due to limited
	access to credits hence might not be able to purchase
	inputs such as pesticides
	• Women have less access to agricultural information,
	technology and knowledge Men dominant most
	decisions at the household and community levels
Gender related	• Opportunities for youths exists in spraying the crop
opportunities	• Increased yields leading to stable supply of cotton to the
VMCs issues and someowns	markets by women and youth
VIVIGS issues and concerns	• VMGs have limited access to productive resources such
in development, adoption	as failed, credit, and quality seeds
and scaling up.	• VINOS have minited access to training and extension services
	<ul> <li>VMGs have limited access to markets as they sometimes</li> </ul>
	cannot travel to far regional markets due to either their
	sickness, disability or lack of exposure
	• Due to their social status VMGs are often excluded from
	decision making in development and dissemination
	activities
	• VMGs have limited access to seed and information on
	new varieties and production techniques
	There is low adoption by VMGs due lack of awareness
VMG related opportunities	• Opportunities for unemployed youths and those
	recovering from drugs exists in spraying the crop

	• Increased yields leading to stable supply of cotton to the markets by VMGs

- Validation of biopesticides and synthetic pesticides in the management of beetle Determine the effects of beetle on the yield, quality and implication on economic returns for the farmer

Integrated Management of Aphids
Management practice
ology, innovation or management practice
Aphids infestation causes up to 70% yield loss on green gram
This is an integrated approach of various control methods suppress
the aphids below economic injury levels.
<ul> <li>Cultural Control <ul> <li>Prepare land well and apply 10 kg CAN/acre and 14 kgs/acre DAP to increase plant vigour</li> <li>Control ants by ploughing and flooding the field to destroy the colonies, expose eggs and larvae to predators</li> <li>Conserve natural enemies (e.g. flower bugs, lady bird beetles, praying mantis, hover flies, green lace wing, long horned grass hoppers and spiders by planting lantana hedges to act as breeding grounds for predators</li> <li>Rotate with non-host crops e.g. maize, upland rice, sorghum, okra, sugarcane, and sunflower to prevent build-up of population. Avoid alternate host crops such as beans, lucerne, pigeon pea</li> <li>Remove heavily infested plant parts and destroy by burning</li> <li>Apply neem based products (e.g. neem oil 40ml/20lts of water, Achook) 2 times/month</li> <li>Spray with soapy water solution (mix 1 tablespoon of teepol detergent with 4 lts of water or use strong jet of water to wash off aphids</li> </ul> </li> </ul>
Chemical Control Use only pest control products recommended by Pest Control Products Board (PCPB) such as: • Use Danadim Blue 40 EC (Dimethoate 400 g/L) • Duduthrin 1.75 EC ( <i>Lambdacyhalothrin 17.5 g/L</i> ) • Spray using 10 - 15 mls/20lts of Karate, Atom or Decis at the rate of 10-15mls/20lts of water • Control of the rate of 10-15mls/20lts of water • Control of the rate of 10-15mls/20lts of water • Control of the rate of 10-15mls/20lts of the rate of 10-15mls/20lts of the rate of the rate of 10-15mls/20lts of the rate of the rate of 10-15mls/20lts of the
Source; A.M. Varela, icipe

Justification B: Assessment of dissemina	Aphid causes direct damage by sucking sap from plant tissues, leading to deformation, reduced plant height with few flowers and shrivelled pods. Aphids cause considerable reduction in yield and lower the grain quality of green grams. Where the aphid is severe and not controlled plants become greatly reduced in size and yield. Losses of above 20-70% are experienced due to the pest under high infestation levels. Marketing of such produce that is severely affected poses challenges and fetches low prices or is rejected. Integrated Management of pests considering food safety concerns should be highly advocated considering that the grain consumed very widely in Kenya. This involves the use of a combination of cultural and bio-control and biopesticides that are relatively safe. Soft synthetic pesticides are recommended as a last option. This minimizes overuse of synthetic pesticides. Adoption of an IPM approach would enhance food safety among the consumers and also contribute to environmental safety. <b>tion and scaling up/out approaches</b>

2.7.5 TIMP name	Integrated Management of Yellow stripped blister beetle
	Disters Declie
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the techno	blogy, innovation or management practice
Problem addressed	Blister beetle causes windowing on flower and leaf tissue with up
	to 40% yield loss
What is it? (TIMP	Integrated management of the beetle includes the use of various pest
description)	control strategies. The strategies include cultural, biological and
	chemical control. In order to realize an effective management
	program for this insect, one has to start chronologically from
	preventive to curative pest control measures i.e. from cultural to
	chemical control. The trend is such that you start with the most
	environmentally friendly (cultural) strategy as you move towards
	starts with pest scouting monitoring pest identification and
	establishment of economic threshold and finally a decision is made
	on which of the following pest control measures to use

	<ul> <li>Cultural control</li> <li>Preventive control measures are sanitation by removal of plants and all debris as soon as harvesting is over.</li> <li>Hand pick and destroy the beettles at the beginning of infestation as this will help to reduce the population density</li> <li>Remove alternative host near the crop</li> </ul>
	<ul> <li>Biological control</li> <li>Use natural enemies such as domestic chicken and allow perching birds to prey on beetles</li> <li>Use biopesticides such as Nimbecidine EC (<i>Azadirachtin 0.03%</i>).</li> </ul>
	<ul> <li>Chemical control</li> <li>Use only pest control products recommended by Pest Control</li> <li>Products Board (PCPB) such as: <ul> <li>Bulldock star EC 262.5 (<i>Beta-cyfluthrin 12.5 g/L</i> + <i>Chlorpyrifos 250 g/L</i>)</li> <li>Tata-alpha 10 EC (<i>Alpha-cypermethrin (10 g/L</i>)</li> <li>Decis 2.5 EC (<i>Deltamethrin25g/L</i>)</li> <li>Duduthrin 1.75 EC (<i>Lambdacyhalothrin 17.5 g/L</i>)</li> </ul> </li> <li>Synthetic pesticides should be used as the last option since most of them are detrimental to the environment</li> </ul>
	Yellow stripped blister beetle, Mylabris blistillat
	Source; A.M. Varela, icipe
Justification	These yellow stripped beetles destroy flowers and buds causing flower defoliation. The beettles cause considerable reduction in yield and lower the grain quality of green grams. Where the beetle is severe and not controlled plants become greatly reduced in size and yield. Losses of above 20-60% are experienced due to the pest under high infestation levels. Marketing of such produce that is severely affected poses challenges and fetches low prices or is rejected. Integrated Management of pests considering food safety concerns should be highly advocated considering that the grain consumed very widely in Kenya. This involves the use of a

B: Assessment of dissemina	combination of cultural and bio-control and biopesticides that are relatively safe. Soft synthetic pesticides are recommended as a last option. This minimizes overuse of synthetic pesticides. Adoption of an IPM approach would enhance food safety among the consumers and also contribute to environmental safety. tion and scaling up/out approaches
Users of TIMP	Producers, Exporters, Researchers, Academia, Farmer
Approaches to be used in dissemination	<ul> <li>On farm and on station research trails and demonstrations</li> <li>Training workshops, Seminars, Meetings</li> <li>Field days</li> <li>Agricultural shows</li> <li>MoA/Extension officers</li> <li>Farmer research networks</li> <li>Farmer to farmer</li> <li>Mass media – Agricultural programs</li> <li>Promotional materials (posters/brochures/leaflets, manuals)</li> <li>Web materials</li> <li>Digital platforms</li> <li>Farmer Field and Business Schools (FFBS)</li> </ul>
Critical/essential factors for successful promotion Partners/stakeholders for scaling up and their roles	<ul> <li>Agricultural innovation platforms</li> <li>Farmers adopt appropriate agronomic practices Have well organized farmer groups and networks e.g. Use of Indigenous Traditional Knowledge (ITK) can be promoted and adopted faster</li> <li>Accessibility and cost of the practice by farmers: low-cost agricultural practices are easily promoted and accepted</li> <li>KALRO to continually undertake research in disease management</li> <li>KEPHIS to ensure seedling quality is maintained</li> <li>PCPB to promote registration of fungicides for disease management</li> <li>Farmers/farmer groups to adopt the technologies</li> </ul>
	<ul> <li>Framers/ramer groups to adopt the technologies</li> <li>County governments, central governments for development of enabling policies and create awareness.</li> <li>Financial institutions to provide credit facilitators</li> </ul>
C: Current situation and future scaling up	
Counties where already promoted, if any	- None at present, this approach is new.
Counties where TIMPs will be up scaled	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot, Baringo, Tana River
Challenges in dissemination	<ul> <li>Farmers have not accepted to adopt IPM technologies</li> <li>Inadequate knowledge on IPM strategies on insect pests infesting green gram and losses attributed to them</li> <li>Poor linkages among stakeholders in green gram value chain</li> </ul>

Suggestions for addressing	PCPB enhance registration of crop protection products
the challenges	• Training of stakeholders in IPM options
	• Establish green gram innovation platforms for technology
	disseminations
	• Dissemination of integrated pest management practices and safe
	use of pesticides
	• Promote appropriate marketing channels e.g. contract farming, collective production and marketing
Lessons learned in up	• Sensitization is necessary for people to appreciate the use of
scaling, if any	IPM in insect management
	• Adoption of good agricultural practices by farmers is key in
	management of the insects
	• Chances of successful scaling are higher when many value chain
	stakeholders collaborate in an innovation platform
	• Partnership is important in technology dissemination and adoption and this can be facilitated through inpovation platforms
Social, environmental, policy	<ul> <li>Favorable environmental conditions</li> </ul>
and market conditions	• Willingness of stakeholders to participate
necessary	• Favorable environmental conditions
	• Regulatory bodies e.g. PCPBP, KBS to ensure insecticides sold
	to farmers are genuine and of high quality
	• Producers willing to adopt the insect management practices
	• Producers are organized in groups to ensure that management
	practices are effectively up-scaled
	• Farm input costs are within the reach of farmers
D: Economic, gender, vulne	rable and marginalized groups (VMGs) considerations.
Basic costs	33,000/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by
	40% (28,800/=). Therefore, the estimated returns will be
	72,000-28,800= 43,200/=
Gender, issues and concerns	• Women and youth have limited access to productive resources
in development,	• Women and youth have limited access to education training
dissemination adoption and	and extension services than men
up scaling	• Women have limited access to markets as they sometimes
	cannot travel to far markets due to their domestic roles
	• Women have less access to agricultural information,
	technology and knowledge
	• Due to their social status women and youth are often excluded
	from decision making in pest management
Gender related	• Opportunities for youths exists in spraying the crop
opportunities	• Increased production of cotton leading to stable supply of
	cotton to the market

VMGs issues and concerns in development, adoption and scaling up.	<ul> <li>VMGs have limited access to productive resources such as land, credit, and quality seeds</li> <li>VMGs have limited access to training and extension services</li> <li>Due to their social status VMGs are often excluded from decision making in development and dissemination activities</li> <li>VMGs have limited access to information on production techniques</li> <li>VMGs have limited access to information such as in integrated management of blister bettles</li> </ul>	
VMG related opportunities	<ul> <li>There is low adoption by VMGs due lack of awareness</li> <li>Employment for youths and those recovering from drugs exists in spraying the crop</li> <li>Improved production for VMGs</li> </ul>

- Capacity building on Yellow stripped blister beetle identification and management
- Validation of biopesticides and synthetic pesticides in the management of Yellow stripped blister beetle
- Determine the effects of Yellow stripped blister beetle on the yield, quality and implication on economic returns for the farmer

2.7.6 TIMP name	Integrated Management of Desert locust (Schistocerca
	gregaria)
Category (i.e. technology, innovation or management practice)	Management practice
A: Description of the techno	ology, innovation or management practice
Problem addressed	90% yield loss occasioned by feeding on foliage which occur in swarm of 5-20 million hoppers
What is it? (TIMP description)	<ul> <li>Integrated management of desert locust is a regional program involving multi-sectoral efforts as follows;</li> <li>A global early warning system of preventive and control of DL is in place. Kenya is a member of Desert Locust Control Organization of Eastern and Central Africa (DLCO-EA).</li> <li>DLCO-EA uses remote sensing technology and ground surveys to identify and control desert locusts (DL) in their breeding sites. It uses satelite imagery for the identification of potential breeding sites and locust infestations.</li> <li>Prevention requires a collective effort across regions.</li> <li>Scouting and control of DL in recession (traditional breeding) regions will prevent infestation in invation (non traditional) regions</li> <li>Scouting should be synchronized with early warning systems reports from FAO</li> <li>Spray hopper bands using Metarhizium anisopliae based products like Mazao achieve (rate 21/ ha), Biomagic 1.5 LF (rate 20g/ 20lts water), Real metarhizium OD (rate 200ml/ ha) among others. Spray at intervals of 3 - 14 days depending on risk of pest damage</li> <li>Spray with Chlorpyrifos ULV based products like Mursban 480 EC (rate 75ml/20lts water), Agropyrifos 48 EC (20ml/20lts water), Regulator 450 EC (20mls/20lts water), Gradomete R 480 EC. (rate is 1 ltr/ha)</li> <li>Spray with Fenitrohion based products like Delta 1.01% Dust, Sumicombi 1.8% Dust, Sumithion super. (rate of 1ltr/ha)</li> </ul>

Justification	Desert locust cause devastating total vegetative loss of many crops which calls for urgent action by the Ministry of Agriculture and all stallabelders in the region to prevent eren loss
B: Assessment of dissemina	tion and scaling up/out approaches
	Des desens Europeters Descendents Academic Europeters
Users of Thimp	agents
Approaches to be used in dissemination	<ul> <li>Agricultural shows</li> <li>MoA/Extension officers</li> <li>Farmer research networks</li> <li>Mass media – Agricultural programs</li> <li>Promotional materials (posters/brochures/leaflets, manuals)</li> <li>Web materials</li> <li>Digital platforms</li> <li>Farmer Field and Business Schools (FFBS)</li> <li>Agricultural innovation platforms</li> </ul>
Critical/essential factors for	Need for farmer involvement helps in test evaluation and up
successful promotion	scaling of what they learn in the process.
Partners/stakeholders for scaling up and their roles	<ul> <li>KALRO to continually undertake research in disease management</li> <li>KEPHIS to ensure seedling quality is maintained</li> <li>PCPB to promote registration of fungicides for disease management</li> <li>Farmers/farmer groups to adopt the technologies</li> <li>County governments, central governments for development of enabling policies and create awareness</li> <li>Financial institutions to provide credit facilitators</li> </ul>
C: Current situation and fu	ture scaling up
Counties where already promoted, if any	- None at present, this approach is new.
be up scaled	Baringo, Tana River
Challenges in dissemination	<ul> <li>Unwillingness of farmers to adopt IPM technologies</li> <li>In adequate knowledge on IPM strategies on insect pests infesting green gram and losses attributed to them</li> <li>Poor linkages among stakeholders in green gram value chain</li> </ul>
Suggestions for addressing the challenges	<ul> <li>PCPB enhance registration of crop protection products</li> <li>Training of stakeholders in IPM options</li> <li>Establish green gram innovation platforms for technology disseminations</li> <li>Dissemination of integrated pest management practices and safe use of pesticides</li> <li>Promote appropriate marketing channels e.g. contract farming, collective production and marketing</li> </ul>

Lessons learned in up scaling, if any	<ul> <li>Sensitization is necessary for people to appreciate the use of IPM in insect management</li> <li>Adoption of good agricultural practices by farmers is key in management of the insects</li> <li>Chances of successful scaling are higher when many value chain stakeholders collaborate in an innovation platform</li> <li>Partnership is important in technology dissemination and adoption and this can be facilitated through innovation platforms</li> </ul>
Social, environmental, policy and market conditions necessary	<ul> <li>Favorable environmental conditions</li> <li>Willingness of stakeholders to participate</li> <li>Favorable environmental conditions</li> <li>Regulatory bodies e.g. PCPBP, KBS to ensure insecticides sold to farmers are genuine and of high quality</li> <li>Producers willing to adopt the insect management practices</li> <li>Producers are organized in groups to ensure that management practices are effectively up-scaled</li> <li>Farm input costs are within the reach of farmers</li> </ul>
Basic costs	28.000/=
Estimated returns	If the farmer doesn't apply the TIMP yield will be reduced by 90% (64,800/=). Therefore, the estimated returns will be 72,000-64,800= 7,200/=
Gender, issues and concerns in development, dissemination adoption and up scaling	<ul> <li>Women and youth have limited access to productive resources such as land, credit, and quality seeds than men</li> <li>Women and youth have limited finances to purchase pesticides</li> <li>Women and youth have limited access to education, training and extension services than men</li> <li>Women have limited access to markets as they sometimes cannot travel to far markets due to their domestic roles</li> <li>Women have less access to agricultural information, technology and knowledge for instance they might not have knowledge of integrated management of Migratory locust</li> </ul>
Gender related opportunities	<ul> <li>Opportunities for youths exists in spraying the crop</li> <li>Inceased production leading to improved livelihoods</li> </ul>
VMGs issues and concerns in development, adoption and scaling up.	<ul> <li>VMGs have limited access to productive resources such as land, credit, and quality seeds</li> <li>VMGs have limited access to training and extension services</li> <li>VMGs have limited access to markets as they sometimes cannot travel to far regional markets due to either their sickness, disability or lack of exposure</li> <li>Due to their social status VMGs are often excluded from decision making in development and dissemination activities</li> </ul>

VMG related opportunities	<ul> <li>VMGs have limited access to seed and information on new varieties and production techniques</li> <li>There is low adoption by VMGs due lack of awareness</li> <li>Opportunities for unemployed youths and those recovering from drugs exists in spraying the crop</li> <li>Increased production leading to improved livelihoods of VMGs</li> </ul>
E. Case studies/ profiles of success stories	
Success stories	-This is the first time the information is being rolled out.
Application guidelines for users	Esilaba, A.O.et al. (2021). KCEP-CRAL Green Gram Extension Manual. Kenya Agricultural and Livestock Research Organization, Nairobi, Kenya CABI-Plantwise Knowledge Bank

- Capacity building on management of desert locusts
- Validation of biopesticides and synthetic pesticides in the management of desert locusts

2.7.7 TIMP name	Integrated management of Bruchid on Green gram
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology, innovation or management practice	
Problem addressed	Bruchids cause up to 100% damage on green gram grain when in
	storage.
What is it? (TIMP	Integrated bean bruchid management consist of various approaches
description)	to prevent grain damage.
	Cultural practises
	Sort grains and remove visibly damaged

	Cover with plastic or store grains with husks
	• Use pheromone traps to attract weevils
	Chemical management
	• Use repellent neem powder to repel
	The pulse beetle, <i>Callosobruchus chinensis</i>
	Source; A.M. Varela, icipe
Justification	Bruchids cause considerable reduction in yield and lower the grain quality of green grams. Where the bruchid is severe and not controlled plants become greatly reduced in size and yield. Losses of above 20-60% are experienced due to the pest under high infestation levels. Marketing of such produce that is severely affected poses challenges and fetches low prices or is rejected. Integrated Management of pests considering food safety concerns should be highly advocated considering that the grain consumed very widely in Kenya. This involves the use of a combination of cultural and bio-control and biopesticides that are relatively safe. Soft synthetic pesticides are recommended as a last option. This minimizes overuse of synthetic pesticides. Adoption of an IPM approach would enhance food safety among the consumers and also contribute to environmental safety.
B: Assessment of dissemina	tion and scaling up/out approaches
Users of TIMPs	Producers, Exporters, Researchers, Academia, Farmers
Approaches used to be used in dissemination	<ul> <li>On farm and on station research trails and demonstrations</li> <li>Training workshops, Seminars, Meetings</li> <li>Field days</li> <li>Agricultural shows</li> <li>MoA/Extension officers</li> <li>Farmer research networks</li> <li>Farmer to farmer</li> <li>Mass media – Agricultural programs</li> <li>Promotional materials (posters/brochures/leaflets, manuals)</li> <li>Web material's</li> </ul>
	Digital platforms

	• Farmer field and business schools (FFBS)
	Agricultural innovation platforms
Critical/essential factors for	• Strong partnership linkages are required
successful promotion	• Suitability of the TIMP to the agro climatic and socio-economic
	condition of the farmer
	Accessibility of the TIMP by the farmers
Partners/stakeholders for	• KALRO to continually undertake research in pest management
scaling up and their roles	• PCPB to promote registration of insecticide for pest
	management
	• Farmers/farmer groups to adopt the technologies
	• County governments, central governments for development of
	<ul> <li>Financial institutions to provide credit facilitators</li> </ul>
C: Current situation and fu	ture scaling un
Counties where already	None of the counties have any experience on the technology as this
promoted, if any	pest has just arrived in the eastern Africa region.
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be up scaled	Baringo, Tana River
Challenges in dissemination	Unwillingness of farmers to adopt IPM technologies
	• In adequate knowledge on IPM strategies on insect pests
	infesting green gram and losses attributed to them
	Poor linkages among stakeholders in green gram value chain
Suggestions for addressing	PCPB enhance registration of crop protection products
the challenges	Training of stakeholders in IPM options
	• Establish green gram innovation platforms for technology
	disseminations
	• Dissemination of integrated pest management practices and safe
	Promote appropriate marketing channels e.g. contract farming
	collective production and marketing
Lessons learned in up	• Sensitization is necessary for people to appreciate the use of
scaling, if any	IPM in insect management
	• Adoption of good agricultural practices by farmers is key in
	Changes of successful scaling are higher when many value chain
	stakeholders collaborate in an innovation platform
	• Partnership is important in technology dissemination and
	adoption and this can be facilitated through innovation platforms
Social, environmental,	Favorable environmental conditions
policy and market	• Willingness of stakeholders to participate
conditions necessary for	Favorable environmental conditions
development and up scaling	• Regulatory bodies e.g. PCPBP, KBS to ensure insecticides sold
	to farmers are genuine and of high quality

2.7.8 TIMP name	Integrated management of Cut worms on green gram	
Category (i.e. technology,	Management practice	
innovation or management		
practice)		
A: Description of the technology, innovation or management practice		
Problem addressed	Cutworms cause up to 100% damage on green gram seedlings	
What is it? (TIMP	Integrated cutworm management consist of various approaches to	
description)	prevent grain damage.	
	Cultural practises	
	• Ploughing exposes caterpillars to predators and to	
	desiccation by the sun.	
	• Prepare field and vegetation and weeds destroyed 14 days	
	before planting	
	• Delaying transplanting slightly until the stems are too wide	
	for the cutworm to encircle and/or too hard for it to cut may	
	reduce cutworm damage.	
	• Hand picking of caterpillars at night by torch or very early	
	morning before they return into the soil is useful at the	
	beginning of the infestation.	
	• Flooding of the field for a few days before sowing or	
--------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	
	transplanting	
	Biological management	
	• Use repellent neem extract 3 times at weekly intervals	
	<ul> <li>Use of ash on the seedbed</li> </ul>	
	<ul> <li>Use of molasses at the base of each plant</li> </ul>	
	• Use of molasses at the base of each plant	
	The cutworm (Agrotis spp),	
T	Source: A.M. Varela, icipe	
Justification	Cut worms cause considerable reduction in yield and lower the grain quality of green grams. Where the cut worm is severe and not controlled plants become greatly reduced in size and yield. Losses of above 20-100% are experienced due to the pest under high infestation levels. Marketing of such produce that is severely affected poses challenges and fetches low prices or is rejected. Integrated Management of pests considering food safety concerns should be highly advocated considering that the grain consumed very widely in Kenya. This involves the use of a combination of cultural and bio-control and biopesticides that are relatively safe. Soft synthetic pesticides are recommended as a last option. This minimizes overuse of synthetic pesticides. Adoption of an IPM approach would enhance food safety among the consumers and also contribute to environmental safety.

2.7.9 TIMP name	Integrated Management of Flower Thrips on green gram
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the techno	ology, innovation or management practice
Problem addressed	Flower thrips cause up to 20-60% yield loss on green gram
What is it? (TIMP	Integrated management (IPM) of thrips involves the use of a
description)	combination of cultural, biological and chemical control methods. These are;
	Cultural Control
	• Maintain a healthy crop as it will tolerate thrips and keep the field weed free
	<ul> <li>Avoid planting new crop near an existing infected field</li> <li>Mulch fields as this helps reduce thrips population</li> </ul>
	• Use overhead irrigation where possible to reduce spread of thrips
	• Remove and destroy volunteer plants and debris that may harbour thrips
	• Uproot heavily infested plant material and burn
	• Apply soapy sprays (mix 5 teaspoon full of soap powder or chopped bar soap with cold water and dissolve and spray on the infested plants
	• Use blue sticky cardboard traps to attract thrips.
	Biological control
	<ul> <li>Apply biocontrol agents e.g Beauvitech WP (Beauveria bassiana) or Bio-Power 1.5L (Beauveria bassiana), or Botanigard ES (Azadirachtin),</li> </ul>
	• Spray neem based products like neemroc EC and nimbecidine (Azadiractin) use 1 lts/acre (10 plastic bottle tops per 20 lts of water).
	<ul> <li>Chemical Control</li> <li>Spray with Spinosad based products eg tracer 480 SC at 4mls per 20lts of water or lambda cyhalothrin products at 7ml per 20l of water or duduthrin at 65mls per 20l of water or Karate at 20gms/ 20l</li> <li>Use synthetic insecticides with PHI of 3 days or less since garden pea is harvesting at very short intervals.</li> </ul>

	Flower thrips ( <i>Megalurothrips sjostedti</i> )
Level Constitution	Source; G1Z-IPM Horticulture, Kenya
Justification	Thrips cause considerable reduction in yield and lower the grain quality of green grams. Where the thrips are severe and not controlled plants become greatly reduced in size and yield. Losses of above 20-60% are experienced due to the pest under high infestation levels. Marketing of such produce that is severely affected poses challenges and fetches low prices or is rejected. Integrated Management of pests considering food safety concerns should be highly advocated considering that the grain consumed very widely in Kenya. This involves the use of a combination of cultural and bio-control and biopesticides that are relatively safe. Soft synthetic pesticides are recommended as a last option. This minimizes overuse of synthetic pesticides. Adoption of an IPM approach would enhance food safety among the consumers and also contribute to environmental safety

	Promotional materials (posters/brochures/leaflets, manuals)
	• Web material's
	Digital platforms
	• Farmer field and business schools (FFBS)
Critical/accential factors for	Agricultural innovation platforms
successful promotion	• Strong partnersmp innkages are required.
successiui promotion	• Suitability of the Thyle to the agro climatic and socio-
	economic condition of the farmer.
	• Accessibility of the TIMP by the farmers.

Partners/stakeholders for	KALRO to continually undertake research in pest management
scaling up and their roles	PCPB to promote registration of insecticide for pest management
	Farmers/farmer groups to adopt the technologies
	County governments, central governments for development of
	enabling policies and create awareness.
C. Current situation and fu	Financial institutions to provide credit facilitators
Counting where already	None of the counting have any experience on the technology of this
Counties where already	none of the counties have any experience on the technology as this nest has just arrived in the eastern A frica region
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be up scaled	Baringo, Tana River
Challenges in dissemination	• Unwillingness of farmers to adopt IPM technologies
	• In adequate knowledge on IPM strategies on insect pests
	Infesting green gram and losses attributed to them
	• Poor inikages among stakenoiders in green gram value
Suggestions for addressing	PCPB enhance registration of crop protection products
the challenges	<ul> <li>Training of stakeholders in IPM options</li> </ul>
the chancinges	<ul> <li>Establish green gram innovation platforms for technology</li> </ul>
	disseminations
	Dissemination of integrated pest management practices
	and safe use of pesticides
	• Promote appropriate marketing channels e.g. contract
	farming, collective production and marketing
Lessons learned in up	• Sensitization is necessary for people to appreciate the
scaling, if any	use of IPM in insect management
	<ul> <li>Adoption of good agricultural practices by farmers is key in management of the insects</li> </ul>
	• Chances of successful scaling are higher when many
	value chain stakeholders collaborate in an innovation
	<ul> <li>Partnership is important in technology dissemination and</li> </ul>
	adoption and this can be facilitated through innovation
	platforms
Social, environmental,	Favorable environmental conditions
policy and market	<ul> <li>Willingness of stakeholders to participate</li> </ul>
conditions necessary for	Favorable environmental conditions
development and up scaling	• Regulatory bodies e.g. PCPBP, KBS to ensure
	insecticides sold to farmers are genuine and of high quality
	• Producers willing to adopt the insect management
	practices
	• Producers are organized in groups to ensure that
	management practices are effectively up-scaled
	• Farm input costs are within the reach of farmers

D: Economic, gender, vulnerable and marginalized groups (VMGs) considerations		
Basic costs	36,600/=	
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by	
	60% (43, 200/=). Therefore, the estimated returns will be	
	72,000-43, 200= 28,800/=	
Gender issues and concerns	• Women and youth have limited access to productive	
in development,	resources such as credit	
dissemination adoption and	• Women and youth have limited access to pest management	
scaling up	training and extension services	
	• Due to their social status women and youth are often	
	excluded from decision making in development and dissemination activities	
	• Youth applying synthetic pesticides should always wear	
	Personal Protective Equipments (PPE's)	
Gender related	• Young male and female youth may be employed to	
opportunities	monitor (pest scouting)	
	• Spraving of the grap during the bollwarm control will	
	• Spraying of the crop during the boltworm control will create employment opportunities for young male youths	
	create employment opportunities for young male youns	
VMG issues and concerns	• VMGs have limited access to productive resources such as	
in development and	credit and pest control products	
dissemination	<ul> <li>VMGs have limited access to training and extension services</li> </ul>	
	• Due to their social status VMGs are often excluded from	
	decision making in development and dissemination	
	activities	
	<ul> <li>VMGs have limited access to pest management</li> </ul>	
	information	
	• There is low adoption by VMGs due lack of awareness	
	• VMG may have a challenge in utilization of spraying	
	equipments	
VMG related opportunities	Opportunities for unemployed rehabilitated male youths	
	exist in pest scouting and cotton spraying programmes.

2.7.10 TIMP name	Integrated management of pod sucking bugs on green gram
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology, innovation or management practice	
Problem addressed	Pod sucking cause up to 100% yield loss on green gram
What is it? (TIMP	Integrated management of Pod sucking bugs consist of various
description)	approaches to prevent plant damage.
	Cultural Control

	• Bugs can be collected by hand regularly and killed.	
	especially during flowering and pod formation	
	• Conserve notural energies such as assessin hugs spiders	
	• Conserve natural enemies such as assassin bugs, spiders,	
	praying mantises and ants.	
	Biological control	
	• Spray Neem products in the morning when the immature	
	stages are exposed.	
	Spiny brown bugs (Claviaralla spn)	
	Source: A M. Verela, joine	
Instification	Ded susking bugs source considerable reduction in yield and lower	
Justification	Pod sucking bugs cause considerable reduction in yield and lower the grain quality of green grams. Where the bug infestation is severe and not controlled plants become greatly reduced in size and yield. Losses of above 20-60% are experienced due to the pest under high infestation levels. Marketing of such produce that is severely affected poses challenges and fetches low prices or is rejected. Integrated Management of pests considering food safety concerns should be highly advocated considering that the grain consumed very widely in Kenya. This involves the use of a combination of cultural and bio-control and biopesticides that are relatively safe. Soft synthetic pesticides are recommended as a last option. This minimizes overuse of synthetic pesticides. Adoption of an IPM approach would enhance food safety among the consumers and also contribute to environmental safety.	
B: Assessment of dissemination and scaling up/out approaches

2.7.11 TIMP name	Integrated management of Bean fly in Green gram
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology, innovation or management practice	
Problem addressed	Bean fly cause up to 30-60 % yield loss on green gram

What is it? (TIMP	Integrated bean fly management consist of various approaches to
description)	prevent grain damage.
	Cultural practises
	• Timely planting early in the season.
	• Planting after green manure crop.
	• Practise crop rotation with non-legumes such cereals.
	• Ridging the plants 2-3 weeks after germination helps to
	cover the adventitious roots produced by plants damaged by
	bean flies
	• Mulch with rice straw.
	• Remove and destroy crop residues and all plant parts with
	symptoms of damage by bean flies.
	Biological management
	• Use botanical insecticides such as neem (100 g of dried leaves in 1 litre warm water (30°C) and kept for 12 hours. Filter and spray)
	• Uproot infested plants from the field and destroy by burning.
	Bean flies (Ophiomyia phaseoli)
	Source; A.M. Varela, icipe
Justification	Bean fly cause considerable reduction in yield and lower the grain
	quality of green grams. Where the bean fly infestation is severe and
	not controlled plants become greatly reduced in size and yield.
	Losses of above 30-60% are experienced due to the pest under high
	infestation levels. Marketing of such produce that is severely
	affected poses challenges and fetches low prices or is rejected.
	Integrated Management of pests considering food safety concerns
	should be highly advocated considering that the grain consumed
	cultural and bio control and bionesticides that are relatively safe
	Soft synthetic pesticides are recommended as a last option. This
	minimizes overuse of synthetic pesticides. Adoption of an IPM

contribute to environmental safety.         B: Assessment of dissemination and scaling up/out approaches

2.7.12 TIMP name	Integrated management of red spider mites on green gram
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the techno	blogy, innovation or management practice
Problem addressed	Red spider mites cause up to 100% damage on green gram grain
	when in storage.
What is it? (TIMP description)	Integrated management of spider mites consists of several approaches applied in an integrated manner to break the cycle of the insect. These include:
	<ul> <li>Cultural Control <ul> <li>Keep the farm weed free from the alternative hosts such as solanum family crops that may habour red spider mites</li> <li>Avoid planting tomato next to infested field or crops.</li> <li>When moving through the farm, start with the healthy area before moving to infected section.</li> <li>Conserve natural enemies or release purchased predatory <i>Phytoseilus</i> species from Real IPM or Dudutech Ltd.</li> <li>Use overhead irrigation as it helps in drowning the mites hence reducing their population</li> <li>Spray with neem extracts (500 grams of leaves in 5 litres of water)</li> <li>Prun overcrowded plants and destroy the crop debris by burning.</li> </ul> </li> </ul>
	Bio-control control
	<ul> <li>Spray with neembicidine based products such as Achook</li> <li>Release predatory mites (<i>Phytotech</i> and <i>Amblytech</i> from</li> </ul>

	<ul> <li>dudutech) <i>Phytoseiulus persimilis</i> species and <i>Amblyseius cucumeris</i></li> <li>Conserve natural enemies in the environment or release purchased predatory <i>Phytoseilus</i> species from Real IPM or Dudutech Ltd</li> <li>Chemical Control</li> </ul>
	• Spray with abamectin 18g/kg based synthetic pesticides
	(Dynamec 20EC 5ml/20litres water, Knockbect 40EC, 10 ml/20 Litre water) or
	• Spray with Amitraz 200g/L based miticides (Kilitac 20EC, Mitac 20 EC. Rate 10ml/20Litre water)
	Red spider mites, <i>Tetranychus spp</i> Source;: Bugwood.org
Justification	Red spider mites cause considerable reduction in yield and lower the
	grain quality of green grams. Where the spider mites infestation is
	severe and not controlled plants become greatly reduced in size and
	yield. Losses of above 20-60% are experienced due to the pest under
	high infestation levels. Marketing of such produce that is severely
	Integrated Management of pests considering food safety concerns
	should be highly advocated considering that the grain consumed
	very widely in Kenya. This involves the use of a combination of
	cultural and bio-control and biopesticides that are relatively safe.
	Soft synthetic pesticides are recommended as a last option. This
	minimizes overuse of synthetic pesticides. Adoption of an IPM
	approach would enhance food safety among the consumers and also
<b>D.</b> Assessment of dissemine	contribute to environmental safety.

	Agricultural innovation platforms
Critical/essential factors for	• Strong partnership linkages are required.
successful promotion	• Suitability of the TIMP to the agro climatic and socio-economic
1	condition of the farmer.
	• Accessibility of the TIMP by the farmers.
Partners/stakeholders for	• KALRO to continually undertake research in pest management
scaling up and their roles	• PCPB to promote registration of insecticide for pest
	management
	• Farmers/farmer groups to adopt the technologies
	• County governments, central governments for development of
	enabling policies and create awareness.
	Financial institutions to provide credit facilitators
C: Current situation and fu	ture scaling up
Counties where already	None of the counties have any experience on the technology as this
promoted, if any	pest has just arrived in the eastern Africa region.
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be up scaled	Baringo, Tana River
Challenges in dissemination	Unwillingness of farmers to adopt IPM technologies
	• In adequate knowledge on IPM strategies on insect pests
	infesting green gram and losses attributed to them
	Poor linkages among stakeholders in green gram value chain
Suggestions for addressing	• PCPB enhance registration of crop protection products
the challenges	Training of stakeholders in IPM options
	• Establish green gram innovation platforms for technology
	disseminations
	• Dissemination of integrated pest management practices and safe
	Bromote enprendiate marketing channels a g contract forming
	collective production and marketing
Lessons learned in up	• Sensitization is necessary for people to appreciate the use of
scaling, if any	IPM in insect management
	• Adoption of good agricultural practices by farmers is key in
	management of the insects
	• Chances of successful scaling are higher when many value chain
	stakeholders collaborate in an innovation platform
	• Partnership is important in technology dissemination and
	adoption and this can be facilitated through innovation platforms
Social environmental	Eavorable environmental conditions
policy and market	<ul> <li>Willingness of stakeholders to participate</li> </ul>
	Favorable environmental conditions
conditions necessary for	Regulatory bodies e.g. DCDRD KRS to ansure insecticides cold
development and up scaling	to farmers are genuine and of high quality
	<ul> <li>Producers willing to adopt the insect management practices</li> </ul>
	- I founcers writing to adopt the insect management practices

	• Producers are organized in groups to ensure that management
	practices are effectively up-scaled
	• Farm input costs are within the reach of farmers
D: Economic, gender, vulne	rable and marginalized groups (VMGs) considerations
Basic costs	47,000/=
Estimated returns	If the farmer doesn't apply the TIMP, yield will be reduced by
	100% (72,000/=). Therefore, the estimated returns will be
	72,000-72,000= 0/=
Gender issues and concerns	• Women and youth have limited access to productive resources
in development,	such as land, credit, and quality seeds than men
dissemination adoption and	• Women and youth have limited access to education, training and
scaling up	extension services than men
	• Women have limited access to markets as they sometimes
	<ul> <li>Women have less access to agricultural information, technology</li> </ul>
	and knowledge
	• Due to their social status women and youth are often excluded
	from decision making in pest management
Gender related	Opportunities for youths exists in spraying the crop
opportunities	• Increased production of cotton leading to stable supply of cotton
	to the market
VMG issues and concerns	• VMGs have limited access to productive resources such as land,
in development and	credit, and quality seeds
dissemination	<ul> <li>VMGs nave limited access to training and extension services</li> <li>Due to their social status VMGs are often evaluated from</li> </ul>
	• Due to their social status vivios are often excluded from decision making in development and dissemination activities
	<ul> <li>VMGs have limited access to information on production</li> </ul>
	techniques
	• VMGs have limited access to information such as in integrated
	management of red spider mites
	There is low adoption by VMGs due lack of awareness
VMG related opportunities	• Employment for youths and those recovering from drugs
	exists in spraying the crop
	Improved production for VMGs

## 2.8 Integrated Weed Management

2.8.1 TIMP Name	Integrated Weed Management in Green gram
Crop management	Management Practice
practices	
A: Description of the techn	ology, innovation or management practice
Problem to be addressed	Low and poor quality yields resulting from a variety of annual and
	perennial grass and broadleaved weed species infestation that
	damage the crop, combined with poor control methods.
What is it? (TIMP	Integrated Weed Management (IWM) is the management of weeds
description)	using two or more appropriate approaches such as preventive, land
	preparation before planting, use of mulch (biodegradable or
	synthetic), cultural, rotation, intercropping and chemical, among
	others, depending on the weed types and intensity in the field.
	Annual and perennial narrow leaved weeds include crab sanguinalis
	(Digitaria sanguinalis), goosegrass (Eleusine indica and difficult to

	control couch grass (Cynodon	dactylon) and sedges (such as yellow
	nutsedge (Cyperus esculentus). Broad leaved include Wondering jew	
	(Commelina benghalensis) and	Black jack (Bidens pilosa).
	Wondering jew (Commelina	Black jack (Bidens pilosa)
	benghalensis)	
	Couch grass (Stellaria	Yellow nut sedge ( <i>Cyperus</i>
	<b>Cultural weed control</b> refers t good soil fertility) that involv that weeds are less likely to be number.	to any technique (such as maintaining es maintaining field conditions such ecome established and/ or increase in
	<b>Physical control</b> is the remova means, such as hand weeding o after crop germination dependin density, weather condition and	l of weeds manually or by mechanical r mowing. Weeding is done 2-3weeks ng on the environment, weed type and soils.
	<b>Chemical weed control</b> is herbicides to control weeds fol weed composition needs to implement timely and the best approach will be effective only	use of appropriate recommended lowing instructions on the label. The be identified and the data used to t management approach because one on some species but not others.
Justification	Different annual and perennial	grass and broadleaved weed species
	combined with inappropriate a	pproaches used to control the weeds
	(because of limited knowledg	e) lead to yield losses and lack of
	profitability in green gram proc	luction. Weeds compete with the crop

	for growth resources such as nutrients, soil moisture, space and
	sunlight Some key weed grass species include goose grass (Eleusine
	indica). Craws foot (Dactyloctenium aegyptium) and difficult to
	control couch grass (Cynodon dactylon) Common broad leaved
	weeds include sow thistle (Sonchus oleraceae) Black jack (Bidens
	nilosa) Gallant soldior (Galinsoga parviflora) Goat wood (A garatum
	priosa), Garrant soluter (Garrisoga parvinora), Goat weed (Ageratum
	conyzoides) and Starbur (Acaninospermum hispidum). Weeds such
	as Amaranthus species eg Red pigweed (A. retroflexus), Sedges such
	as Yellow nutsedge (Cyperus esculentus), Wondering jew
	(Commelina benghalensis), Witchweed (Striga hermonthica) and
	Ragweed (Parthenium hysterophorus) are a challenge and difficult to
	control in green gram growing fields or regions where they have
	succeeded because of their morphological and phenological
	characteristics.
	Although manual weeding mainly done by farmers can be effective
	for managing some weed species, it is time consuming and labour
	intensive. It can be ineffective when done under wet conditions for
	weeds such as wandering jew (Commelina benghalensis) and
	purslane (Portulaca oleraceae) as they get disseminated and re-grow
	through cuttings. A combination of more than one management
	practice has been reported to give a promising option for timely and
	efficient weed control in green gram cropping systems. There is
	therefore the need to apply IWM approach to control the biodiversity
	of weeds in green grams.
B: Assessment of dissemina	ation and scaling up/out approaches
Users of TIMP	Farmers, Extension workers, Agrodealers
Approaches used in	Demonstrations and field days.
dissemination	Mass Media
	Manuals, pamphlets, fact sheets
Critical/essential factors	• Promote and train on integrated weed management (IWM) in
for successful promotion	green gram production.
	• Address environmental and safety concerns related to the use of herbicides
	• Accompany the promotion with demos and field days with
	farmers groups and various stakeholders on the effectiveness
	of the various weed management options using FFSB
	approach.
	• Train users on appropriate/ safe use of herbicides.
	• Irain stakeholders on identification and biology of weeds
	Farmers need training on timing with regard to conservation of
	high high to preserve pollinators for increased productivity of
	weed control

Partners/stakeholders for	Agrochemical companies and Agrodealers- Dissemination of
scaling up and their	information
respective roles.	• Research partners-(KALRO and CGIAR)-Research
	• County extension Officers and NGOS- Extension Services
C. Current situation and fu	and dissemination of information
Counties where already	Machakos Makueni
promoted if any	Wachakos, Wakuchi,
Counties where TIMPs	All counties suitable for growing green gram including Kakamega,
will be up scaled	Rift valley, Central, Eastern, and Coast.
Challenges in development and dissemination	<ul> <li>Lack of green gram innovation platforms to facilitate interaction of farmers with relevant stakeholders</li> <li>Low use of the technology</li> <li>Labour intensity and high cost of herbicides</li> <li>Inadequate knowledge and information on which herbicides to use, when to use them and their persistence in the soil.</li> <li>Myths on appropriateness of using herbicides</li> </ul>
Suggestion for addressing the challenges	<ul> <li>Promotion of the IWM by conducting demos and field days and involvement of the stakeholder e.g. agro-chemical companies and agro-dealers.</li> <li>Develop and disseminate information to various stakeholders.</li> <li>Training on integrated approaches using available methods,</li> </ul>
	<ul> <li>Including appropriate herbicides for green gram.</li> <li>Training on safe use of herbicides to address the issue of residues in the crop and persistence in different soil environment that can carried over to follow up crops during rotation.</li> </ul>
Lesson learned in up scaling if any	• Integrated approaches of weed management are more effective than use of one control method.
	• Continuous use of herbicides is an environmental, health and social hazard hence the need to follow instructions on the label.
	• Vegetable rotations are very fast and intensive in many places and herbicide toxicity can affect next crop if the cycle of previous crops is short enough.
	• Consumers concerns regarding the safety of crops due to pesticide residues need attention.
Social, environmental, policy and market	<ul> <li>Train farmers to understand benefits of and how IWM works.</li> <li>Have an environmental and safety plan when using</li> </ul>
conditions necessary for	herbicides.
development and up-	• Address the environmental and social concerns related to use
scaling	of agrochemicals.
	• A functional agro-dealer network to supply registered herbicides when required by the farmers
D: Economic, gender, vuln	erable and marginalized groups (VMGs) considerations
Basic costs	Not Determined

Estimated returns	Not Determined
Gender issues and concerns in development and dissemination	<ul> <li>Women and youth have limited access to production resources such as land, capital to purchase herbicides</li> <li>Women work is complicated by their multiple roles they do such as such domestic roles</li> <li>Women and youth have limited access to education, training and extension services</li> <li>Women have less access to agricultural information, technology and knowledge on IWM</li> <li>Women and youth have less access to extension training</li> <li>Make all gender understand the benefits of IWM.</li> <li>Empower both men and women to make a judicious decision on IWM approach.</li> <li>Use of IWM technology can reduce labour from manual weeding and save time for other activities for women and children</li> </ul>
Gender related opportunities	<ul> <li>Women and youth to generate income from weeding</li> <li>Women and youth to generate income from agro dealer business</li> <li>Women and youth to generate income by starting cortege value addition factories due to enhanced yield</li> <li>There will be improved food security and nutrition from for women</li> <li>There will be increased job security for women and youth by spraying herbicides</li> <li>There will be increased production since the weed competes with plants leading to low production</li> </ul>
Vulnerable and marginalized groups (VMG) issues and concerns in development, dissemination, adoption and scaling up	<ul> <li>VMG groups could have limitations in accessing the knowledge, resources and exposed to many threats such as insecurity and land disputes.</li> <li>VMG have less access to extension training as they are not given equal opportunities</li> <li>VMG have less access to knowledge and information on IWM</li> <li>VMG have less access to capital to purchase herbicides</li> </ul>
VMG related opportunities	<ul> <li>VMG to generate income from agro dealer business</li> <li>VMG to generate income by starting cortege value addition factories due to enhanced yield</li> <li>There will be increased production leading to increase food security and nutrition for VMGs</li> </ul>

2.8.2 TIMP name	Mulching for weed management in greengram production
Category (i.e. technology,	Management Practice
innovation or management	
practice)	
A: Description of the techno	logy, innovation or management practice
Problem addressed	Diversity of annual and perennial grass and broadleaved weed
	species infestation compete with green gram for growth resources
	and improper weed control measures that lead to low and poor
	quality yields.
What is it? (TIMP description)	The practice of covering the soil/ ground with natural or synthetic materials to effectively control germination of weed seeds in or at the soil surface using biodegradable or natural mulches. Biodegradable mulches include straw, grass and dead leaves. Organic mulches (maize stovers commonly used) should be between 2-4 inches deep to effectively prevent weed germination and suppress the growth in green gram fields. In addition organic mulches retain moisture in the soil; keep the soil cool; and help improve soil fertility and improve microclimate when they decompose. Synthetic mulches will solarize soils, suppress weed growth, prevent seed germination and retain soil moisture. Inspect and pull out emerging weeds timely.
Justification	Black polythene prevents weed seed germination and light from reaching the small weeds which then become weak and die. In
	addition to minimizing weed infestation organic mulches (such as
	straws and dry grass) facilitate retention of soil moisture there by
	controlling temperature fluctuations, improves physical, chemical
	and biological properties of soil by adding nutrients to the soil
	which enhances the growth and yield of green gram. It also
	improves soil structure directly by preventing impact of raindrop

	(soil erosion) and indirectly by promoting biological activity.
	Although a common farmer may not afford, synthetic mulches are
	easy to obtain and apply, and are reusable.
<b>B:</b> Assessment of dissemination	ion and scaling up/out approaches
Users of TIMP	Farmers, Researchers, Extension Agents, Service providers
Approaches used in	• Farmer field and business Schools(FFBS)
dissemination	<ul> <li>Agricultural Innovation Platforms (AIP)</li> </ul>
	• Farmer field Business schools
	• On-farm demonstrations during farmer field days
	• Training in workshops
Critical/essential factors for	• Applied and adaptive Research to test, validate and release
successful promotion	mulching technology in sorghum varieties
	• A platform for interaction of sorghum value chain stakeholders
	• Availability of plant or crop residues for organic mulches.
	• Size of the land.
	• Competing uses of crop residues.
	• Type and availability of the crop residues
	• Cost and availability of synthetic materials
	Disposal of synthetic material after use.
Partners/stakeholders for	KALRO to provide Research services
scaling up and their roles	• County governments and MoALF to provide extension
	services, farmer mobilization and policy formulation
	NGOs to provide micro financing services
C: Current situation and fut	ure scaling up
Counties where already	Machakos, Kitui, Makueni
Current extent of reach	Available and practiced in different eron value chains
Counties where TIMP will	Where green gram is a priority value chain
be promoted	where green grain is a priority value chain.
Challenges in dissemination	• Lack of green gram innovation platforms to facilitate
	interaction of farmers with relevant stakeholders
	• Low use of the agronomic practice
	• Labour intensity and availability of mulching materials
	• Lack of enough plant and crop residues due to competing uses
	of organic mulches.
	• Possibilities of insect build up categorized as pest or disease
	vectors or weed seeds in organic mulches. Be aware of small
	tears and rips which will allow weeds to emergence through
	plastic mulches including around the holes. The nutsedges and
	oxalis may penetrate mulches as early as six days after
Suggestions for addressing	Establish green gram innovation platforms
the challenges	<ul> <li>Cron diversification to increase availability of organic</li> </ul>
	mulches
	• Establish and follow a good integrated weed management
	control program for the particular green gram varieties.

	• Monitor for any tears /rips and pull out any weeds without
	allowing them to take over.
	• Adapting alternative mulching materials like high absorbance polymers.
Lessons learned	• Chances of successful scaling are higher when diverse value
	chain stakeholders collaborate in an innovation platform
	• Creation of awareness through demonstrations and farmer field
	days help in adoption of the technology/ IWM
	• Availability of market is essential
	• Partnership is important in technology dissemination and
	adoption and this can be facilitated through innovation platforms
	• There is need to adapt to alternative mulching technologies
	such as use of a black polythene in addition to organic materials
	like straws dry leaves, and dry grass.
	Mulching in green gram is environmentally friendly
Social, environmental, policy	Mulching practice is socially acceptable
and market conditions	• Increased productivity will provide supply to the markets
necessary	Availability of supporting frameworks/ policies
D: Economic, gender, vulner	able and marginalized groups (VMGs) considerations
Basic costs	To be determined
Conder issues and concorres	To be determined
in development	• The work is mainly done by women who have any other roles
dissemination adoption and	• Women might not be aware that mulching is used as a weed
scaling up	• women might not be aware that mulching is used as a weed control
	• Women have limited access to productive resources such as land so they might not have enough residues to do mulching
	• The practice uses remnants from previous crops/plants that may offer competition in terms of fuelwood and livestock thus bringing a conflict those performing the specific tasks, e.g. women in case of fuelwood and men for livestock feed. This will negatively affect the adoption and scaling up.
Gender related opportunities	• Women who mainly perform the weeding tasks will get a relief and spend their efforts elsewhere.
	• Similarly, the improved productivity will benefit both gender in terms of higher earnings.
VMG issues and concerns in	• Though easy to use, it is labour intensive for VMGs, hence its
development, dissemination,	adoption and scaling up is a challenge.
adoption and scaling up	• VMGs have limited access and control of productive resources
	such as land
	• The VMGs have no finances to pay hired labor due to limited access to credit facilities
VMG related opportunities	• Mulch is locally available on-farm, and thus has very low costs
	implying that all including
	• VMGs can take advantage of the practice
	Improves food production and nutrition for VMGs.
E: Case studies/profiles of su	ccess stories

Success stories	Farmers in different value chains have reported improved soil
	conditions, reduced runoff and nutrient loss, soil moisture
	retention in the soil and generally increased crop production
	following application of mulching technology.
Application guidelines for	Esilaba, A.O.et al. (2021). KCEP-CRAL Green Gram Extension
users	Manual. Kenya Agricultural and Livestock Research
	Organization, Nairobi, Kenya

	Private Public Partnerships

2.8.3 TIMP Name	Solarization bed for weed control in green gram
Category (i.e. technology,	Innovation
innovation or management	
practice)	
A: Description of the techno	ology, innovation or management practice
Problem to be addressed	A rich dormant seed bank of diverse annual and perennial grass and
	broadleaved weed species in the soil which germinate and compete
	with the crop for growth resources such as nutrients leading to yield
	losses.
What is it? (TIMP	Solarisation is a method where transparent/ clear polythene films/
description)	plastic is used to heat the soil and kill weed seedlings and dormant
	seeds in the top six inches of the soil. This increases soil
	temperatures by about 10°C or more than atmospheric. The basic
	phenomenon is building up of lethal high temperatures in the soil
	where most dormant and viable seeds are present.

	Folderization of soil using transparent polythene film. Source: infonet-biovision.org
	The mechanism can increase soil temperature by 8-12 °C over non mulched soil which kills seeds and rhizomes of annual and perennial weeds if not deeply buried. Effectiveness depends on specific species and also the length of period of heating.
Justification	Solarization for two consecutive years is successful in controlling perennial weeds. The Mechanism effectively breaks the dormancy of weed seeds, solar scotching of emerged weed seedlings and direct killing of weed seeds by heat. Solarization with 0.05mm T Polythene sheets for 40 days is effective in controlling weeds than use of 0.01mm polythene and takes shorter time duration. This is a good ecological and environmentally friendly method that is sustainable for small scale organic growers. If done properly, the use of post-emergent herbicides to control weeds is not necessary.
Region promoted	Non
Counties where TIMP will	Solarization weed control can be upscaled in all the areas where
be upscaled	green gram of high value is being grown especially for organic farmers.
<b>B:</b> Assessment of disseminat	tion and scaling up/out approaches
Users of TIMP	Farmers and extension agencies
Approaches used in	• Farmer field and business Schools(FFBS)
aissemination	Agricultural Innovation Platforms (AIP)
	• On-farm experimentation and dissemination
	• Demonstrations on larger plots
	• Field days, shows, farmer to farmer communication, leaflets, training on how to use solarization.
Critical/essential factors for successful promotion	<ul> <li>Applied and adaptive Research to test, validate and release solarisation bed technology weed control in green gram varieties</li> <li>A platform for interaction of green gram value chain</li> </ul>
	stakeholders
	<ul> <li>Development of the agronomic practice for green gram</li> <li>Capacity building and training on use of polythene and solar power.</li> </ul>

Partners/stakeholders for	• Public and private partners (MOALF&I) for extension.
scaling up and their	• FIPs (Farmer Input Promotion) for promotion.
respective roles	• Farmer Groups for activity implementation and promotion.
	• Service provider agencies e.g. Micro-finance agencies and banks
	for credit provision, agro-vets for input supply.
	• Processors and manufacturers to create market for produce
	aggregators e.g. CARD (Community Action for Rural
	Development) for economy of scale sales and marketing] and
	Others e.g. NGOs CBOs and FBOs to provide specialist
	services like community mobilization nutrition training etc
C: Current situation and fu	ture scaling un
Current extent of reach	Validation of solarization needs to be done before recommendations
Current extent of reach	are given to the farmers
Challenges in dissemination	• Lack of groon gram innovation platforms to facilitate interaction
chanenges in dissemination	• Lack of green grain innovation platforms to facilitate interaction
	• Low use of the agronomia practice
	Low use of the agronomic practice
	• Labour intensity
	• Limited knowledge and information and low interacy levels
	among the farmers.
	• Capacity building is required to impart knowledge and skills in
	appropriate use and application of solarization.
	• The farmers need to understand the proper use and application of
	solarization to avoid buying inappropriate polythene and
	minimize health, environmental and social hazards.
Recommendations for	• Establish green gram innovation platforms
addressing the challenges	• There is need to train the agricultural extension county officers
	as IOIs on appropriate use of solarization. This help in
	reaching the farmers with the information.
	• Polythene disposal should be done carefully to avoid
	environmental, health and social hazards.
	• Liaise with the Agricultural extension and environmental officers
	on the ground for farmer empowerment and guidance on reuse
<b>x</b> 1 1	and polythene disposal.
Lessons learned	• Chances of successful scaling are higher when diverse value
	chain stakeholders collaborate in an innovation platform.
	• Awareness creation through demonstrations and farmer field
	days help in adoption of the technology of Solarisation bed for
	weed control
	• Availability of market is essential
	• Partnership is important in technology dissemination and
	adoption and this can be facilitated through innovation
	platforms.
	• Access to and use of information on different methods of weed
	control will reduce drudgery and cost of weed management. It
	could give room to increased area under green gram cultivation
	and increase productivity.

	• Solarization to control weeds is cheaper than manual weed
	control because it requires less labour and achieves timely weed
	management.
Social, environmental,	Sensitization of communities on alternative methods of weed
policy and market	control and appropriate use of transparent polythene is very
conditions necessary	necessary.
D: Economic, gender, vulne	rable and marginalized groups (VMGs) considerations
Basic costs	Not determined
Estimated returns	Not determined
Gender issues and concerns	• Women are left out when it comes to formation green gram
in development and Gender	innovation platforms to facilitate interaction of farmers with
issues and concerns in	relevant stakeholders
development, dissemination	• Women are not able to attend organized agricultural trainings
concerns in adoption and	and meetings due to their domestic roles and other activities
scaling up dissemination	which takes much of their time
	• Women have limited access to agricultural technologies and
	information due to their social status in the society
	• Limited knowledge and information and low literacy levels
	among the farmers
	• Women have limited finances to purchase the required
	equipment for the TIMP
	<ul> <li>Canacity building is required to import knowledge and skills in</li> </ul>
	• Capacity building is required to impart knowledge and skins in appropriate use and application of solarization
	The farmers need to understand the proper use and application of
	solarization to avoid buying inappropriate polythene and minimize
	health environmental and social hazards
	Need to sensitize both men and women on value of cron losses
	caused by weed competition
VMG related opportunities	• Women and children are the main sources of labour in green
vivio related opportunities	gram production
	<ul> <li>A doption of technology will reduce the labour burden for women</li> </ul>
	and children
	• There will be increased production of green grams hence
	• There will be increased production of green grains hence increased food security and nutrition
	increased food security and nutrition
VMG issues and concerns	• VMCs are left out when it somes to formation group group
in development	• VMOs are left out when it comes to formation green gram
dissemination adoption	relevant stakeholders
and scaling up	• VMCs are not able to attend argonized agricultural trainings and
und sound up	• vivios are not able to attend organized agricultural trainings and meetings due to financial constraints as they have limited
	access to credits
	Due to prejudice associated with their social status VMCs are
	evoluded from accessing benefits from improved technologies
	Affirmative action is required to promote the solarization for the
	VMGs including value addition aspects
	v mos merualing value addition aspects.

VMG related opportunities	• Increased production will lead to increased consumption of green gram of high nutritive value hence improved health of VMGs; high value of crop will lead to economic empowerment of VMGs.

2.8.4 TIMP Name	Stale seed bed for Weed Control in green gram
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technology, innovation or management practice	
Problem to be addressed	A rich dormant seed bank of diverse annual and perennial grass and broadleaved weed species in the soil which germinate and compete with the crop for growth resources such as nutrients leading to yield losses.
What is it? (TIMP description)	A weed management practice in which weed seeds just below the soil surface are allowed/ stimulated to germinate after rainfall or wetting the soil and then killed prior to planting the green gram seeds while minimizing soil disturbances. Weeds are killed using post-emergent herbicides such as glyphosate, sulfosate and glufosinate, or ploughed into the soil. At this stage shallow or use of non-residue paraquat may be used to destroy dense flush young weed seedlings. This is followed by sowing the selected green gram. Several passes made in the soil with roto Spike tooth hallow is useful to destroy the emerging weeds during preparation of stale beds.

Justification	The technology effectively controls broad and narrow leaved weeds that germinate and emerge before the crop is planted. Competition from weeds deprive green of available resources leading to weak and stunted growth in the young crop depending on weed density and diversity, stage of weed growth and environment. Grass weeds such as crab sanguinalis ( <i>Digitaria sanguinalis</i> ), goose grass
	( <i>Eleusine indica</i> ) and couch grass which is difficult to control are killed after they germinate. Likewise broadleaved weeds such as amaranths species (eg Red pigweed ( <i>A. retroflexus</i> )), datura ( <i>Datura stramonium</i> ) and black jack ( <i>Bidens pilosa</i> ) are killed. Weeds whose control is difficult and challenging but can be
	( <i>Commelina</i> species), parthenium and stiga species.
Region promoted	-
Counties where TIMP will	Stale weed bed control can be upscaled in all the areas where
be upscaled	green gram is being grown.
B: Assessment of dissemination and scaling up/out approaches	
Users of TIMP	Farmers and extension agencies
Approaches used in dissemination	• Farmer field and business Schools(FFBS)
dissemination	<ul> <li>Agricultural Innovation Platforms (AIP)</li> <li>Training workshops, Saminars, Mastings</li> </ul>
	<ul> <li>On-farm experimentation and dissemination field days</li> </ul>
	shows
	• Farmer to farmer communication, leaflets, demonstrations
	on larger plot, training on how to use stale bed.
Critical/essential factors for	• Applied and adaptive Research to test, validate and release
successful promotion	stale seed bed for weed control in sorghum varieties
	<ul> <li>A platform for interaction of sorghum value chain stakeholders</li> </ul>
	• Capacity building and training on use of polythene and
	stale bed
Partners/stakeholders for	• Public and private partners –(MOALF&I) for extension,
scaling up and their	<ul> <li>Chemical companies for back stopping.</li> </ul>
respective roles	• FIPs (Farmer Input Promotion) for promotion.
	• Farmer Groups for activity implementation and promotion.
	• Service provider agencies e.g. Micro-finance agencies and banks
	for credit provision, agro-vets for input supply.
	• Processors and manufacturers to create market for produce,
	Development) for economy of scale sales and marketing and
	Others e.g. NGOs, CBOs, and FBOs to provide specialist
	services like community mobilization, nutrition training etc.
C: Current situation and fut	ure scaling up
Current extent of reach	Validation of these stale beds needs to be done before
	recommendations are given to the farmers.
Challenges in dissemination	• Lack of green gram innovation platforms to facilitate
	interaction of farmers with relevant stakeholders
	• Low use of the technology
	• Labour intensity

	• Limited knowledge and information and low literacy levels	
	<ul> <li>Capacity building is required to impart knowledge and</li> </ul>	
	skills in safe use and application of stale beds.	
	• The farmers need to understand the proper use of stale weed	
Recommendations for	• Establish green gram innovation platforms	
addressing the challenges	<ul> <li>There is need to train the agricultural extension county</li> </ul>	
	officers as TOTs on appropriate use of stale beds. This help	
	in reaching the farmers with the information.	
	• Agricultural extension and environmental officers on the ground for farmer empowerment and guidance on use of	
	stale bed.	
Lessons learned	• Chances of successful scaling are higher when diverse value	
	<ul> <li>chain stakeholders collaborate in an innovation platform</li> <li>Creation of awareness through demonstrations and farmer</li> </ul>	
	• Creation of awareness through demonstrations and rather field days help in adoption of the technology- Stale seed bed	
	• Availability of market is essential	
	• Partnership is important in technology dissemination and	
	adoption and this can be facilitated through innovation	
	• Consumers concerns of herbicide residues in the soil and	
	subsequent crops needs attention	
	• Access to and use of information on different methods of	
	weed control will reduce drudgery and cost of weed	
	cultivation and increase productivity.	
Social, environmental,	Sensitization of communities on alternative methods of weed	
policy and market conditions	control and appropriate use of stale beds is very necessary.	
necessary D: Economic gondor vulno	rable and marginalized groups (VMCs) considerations	
Basic costs	Not determined

2.8.5 TIMP Name	Mechanical weed control in green gram production
Category (i.e.	Management Practice
technology,	
innovation or	
management	
practice)	
A: Description of the	technology, innovation or management practice
Problem to be	Annual and perennial grass and broadleaved weed species infestation that
addressed	compete with the crop for growth resources such as nutrients leading to low
	yields of poor quality.
What is it? (TIMP	Mechanical/ manual weed control is a technique that manages weed
description)	populations through physical methods that remove, injure, kill, or make the
	growing conditions unfavourable for growth using tools such as pangas,
	jembes and slashers. Some of the methods cause direct damage to the weeds
	alter the growing environment by eliminating light increasing the
	temperature of the soil or depriving the plant of carbon dioxide or oxygen
	Mechanical control can be either selective or non-selective. A selective
	method has very little impact on non-target plants where as a non-selective
	method affects the entire area that is being treated I and is prenared well
	using hand tools to get a weed free seedbed. Sowing is done in rows to
	facilitate inter- row weeding. Timely manual weeding is done 2-3 weeks
	after germination followed by a second weeding 2 to 3 weeks later
	depending on the rate of regrowth.
	1.Sub-soller for land tillage       2. Clean seed bed prepared manually         Sources Hottensish Museusi
	Source: Hollensian Mwangi Wooding dology that may recent into wood take over with reculting in severe
	competition with the green gram is avoided. The right tools for weading are
	used to avoid shock-stress on green gram due to disturbance and root
	damage because the young green gram plant is very sensitive The intra row
	weeds can also be removed by hand pulling
	weeds can also be removed by nand pulling.

Justification	Manual hand weeding is labour intensive. It is commonly done late when weeds have competed and taken over the green gram crop. If mechanical control methods are applied at the entimel time and intensity, some wood	
	control methods are applied at the optimal time and intensity, some weed species may be controlled or even eradicated from the fields. If not	
	controlled weeds will take over win the competition and cause yield losses	
	Deep tilling maximizes soil disturbance and brings dormant weed seeds to	
	the surface for germination. Some species are known to be deeply buried	
	and remain dormant in the soil for years before favorable conditions allow	
	germination. By tilling the farmer increases the chances for weed seed	
	germination. The fine soil allows weed seed to grow rapidly by allowing	
	the seed to open and roots to spread easier than compact soils. These	
	emerged weeds can then be destroyed by mechanical weeding to get a clean	
	crop that will give good yields.

2.8.6 TIMP Name	Chemical weed control in green gram production	
TIMP Name	Herbicide (Chemical) Weed Control	
Category (i.e.	Management Practice	
technology,		
innovation or		
management		
practice)		
A: Description of the technology, innovation or management practice		
Problem to be	Diversity of annual and perennial narrow and broadleaved weed species	
addressed	that compete with green gram for nutrients leading yield losses to low and	
	poor quality yields.	
What is it? (TIMP	Chemical weed control is a technology used to control the germination and	
description)	growth of the weed species through application of chemicals/ herbicides to	
	weeds or the soil. The technology requires intensive knowledge on the	
	mode of action of the herbicides, the selective ones for sorghum,	
	conditions necessary for application to be effective, type of soil, when to	
	apply and how application is done. Use only recommended herbicides	
	listed by Pesticide Control Board.	

	Application of a pre-emergent herbicide on the soil Source: Hottensiah Mwangi	Appllying pre-emergent herbicide to kill weeds after manual tillage Source: Violet Momanyi
Justification	Appropriate use of herbicides (applications done at the right time and rate indicated on the label) kills weeds there by reducing drudgery and allows timely weed control. Several pre-emergent and post-emergent selective herbicides are registered for control of annual and perennial broad leaved weeds in millet.	
	<b>Pre-emergent</b> herbicides applied planting include Lasso and Linuron and broad leaved weeds. Lasso is Linuron at 60 - 80g in 20 litres of	on the soil same or following day after a prevent the germination of both narrow applied at a rate of 150 - 170mls and water.
	<b>Post emergent herbicides</b> are ap weeds in the middle rows of green crop. The herbicide 2,4-D 600 SL - 2.3/ ha) in the middle of the r effectively kills broad leaved wee 200-600mls in 20 litres of water (2 weeds. Planting should then be do use the rate indicated on the label walking speed, proper calibration sprayer pressure and flow rate fr effective control.	pplied to kill germinated broad leaved gram using a hood to avoid injury to the applied at a a rate of 100 - 200 mls (1.6 ows 2-3 weeks after crop germination ds while glyphosate applied at a rate of -3 litres/ ha) effectively kills germinated one 2-3 weeks after application. Always I to effectively control weeds. Constant of the sprayer, maintenance of correct rom each nozzle is required to ensure

Challenges in	• Lack of green gram innovation platforms to facilitate interaction of
dissemination	farmers with relevant stakeholders
	• Low use of agronomic practice
	• Limited knowledge and information and low literacy levels among
	the farmers or sprayers to read and interpret label instructions.
	• Capacity building is required to impart knowledge and skills in safe
	use and application of herbicides.
	The farmers need to understand the proper use and application of
	herbicides to avoid buying inappropriate herbicides and minimize
	health, environmental and social hazards.
Recommendations	<ul> <li>Establish green gram innovation platforms</li> </ul>
for addressing the	• There is need to train the agricultural extension county officers as
challenges	TOTs on appropriate use of herbicides. This help in reaching the
	farmers with the information.
	• Herbicides like all chemicals have to be used with care to avoid
	environmental, health and social hazards.
	• Liaise with the Agricultural extension and environmental officers
	on the ground for farmer empowerment and guidance on safe use
	of herbicides.
Lessons learned	• Chances of successful scaling are higher when diverse value chain
	stakeholders collaborate in an innovation platform
	• Creation of awareness through demonstrations and farmer field
	days help in adoption of the technology- chemical weed control
	• Consumers concerns of herbicide residues in the soil and
	subsequent crops needs attention
	• Availability of market is essential
	<ul> <li>Partnership is important in technology dissemination and adoption</li> </ul>
	and this can be facilitated through innovation platforms

Social, environmental, policy and market conditions necessary <b>D: Economic, gender</b> Basic costs Estimated returns Gender issues and	<ul> <li>Access to and use of information on different weed control methods will reduce labour and cost of weed management. It could give room to increase area under cultivation and increase productivity.</li> <li>Sensitization of communities on alternative methods of weed control and appropriate use of herbicides is vital.</li> <li>vulnerable and marginalized groups (VMGs) considerations         Not determined         Not determined         Need to sensitize both men and women on value of crop losses caused by wead compatition     </li> </ul>
development and dissemination	by weed competition
Gender issues and concerns in development, dissemination concerns in adoption and scaling up	<ul> <li>Women and children are the main sources of labour for this crop.</li> <li>Adoption of technology will reduce the labour burden on women and children. The children can get time for school work, while the women can engage in other economic activities.</li> <li>Women and youth have limited access to productive resources such as credit to buy weed control chemicals</li> <li>Women and youth have limited access to education, training and extension services and on new technologies such as weed control chemicals</li> <li>Women have less access to agricultural information, technology and knowledge</li> <li>Men dominant most decisions at the household and community levels on types of chemicals to use at the farm level</li> <li>Women have limited access to funding as compared to men to purchase the weed chemicals</li> <li>There is slow information and awareness flow to female farmers due to their low academic levels</li> </ul>
Gender related opportunities	<ul> <li>The technology would create employment for the youth and women</li> <li>Youth could form groups and engage in spraying weed using weed control chemicals</li> <li>The adoption of the TIMP will lead to reduced work for women as it will attract men into engaging into weeding</li> <li>There will be increased yields and sales leading to improved food and nutrition security</li> </ul>
VMG issues and concerns in development, dissemination, adoption and scaling up	<ul> <li>VMGs have limited access to productive resources such as land, credit to access fertilizers and farmyard manures.</li> <li>VMGs have limited access to training and extension services such as chemicals used in weed control</li> <li>VMGs have limited access to markets as they sometimes cannot travel to far regional markets due to their status to purchase weed control chemicals</li> </ul>

VMG related	Use of herbicides will improve weed management leading to increased
opportunities	productivity, increase availability of green gram for consumption which
	will improve food security hence improved health of VMGs; high value of
	crop will lead to economic empowerment of VMGs.

2.8.7 TIMP Name	Safe Use of herbicides in green gram production
Category (i.e.	Management practice
technology, innovation	
or management	
practice)	
A: Description of the te	chnology, innovation or management practice
Problem to be	Excessive herbicide application to crops and the soil, use of herbicides
addressed	for spraying crops without wearing the right protective clothing, storage
	of herbicides in non-designated stores, wrong application techniques,
	spraying at the wrong times and against the wind direction, and use
	without following the guidelines provided on the labels (eg rate and Pre-
	Harvest Interval), disposal of expired herbicides and empty containers.
	Inadequate enforcement of global and national policies and regulation
	on use of pesticides.
What is it? (TIMP	The technology includes methodologies for proper herbicide handling,
description)	application, and disposal of left overs and containers in order to
	minimize pollution of the environment and contamination of the
	produce. Capacity building of farmers, crop protection spray teams on
	safe handling and use of herbicides right from transportation from the
	agro-dealers to storage in their houses, mixing procedures and their
	application in the field in order to ensure safety of the crop, the person
	handling them and the environment at large.

Instification	Although cases of improper and misuse use of pesticides are very	
Justification	common in most of the areas where maize is grown, they are not	
	documented. There have been incidences of excessive use improper	
	handling that load to the spray operators inhaling the chemicals in the	
	nandling that lead to the spray operators innaling the chemicals in the	
	process of spraying, use of inappropriate spray equipment that lead to	
	leakages and thereby exposing the operators to health risks as well as	
	contamination of the water bodies. Most of these irregularities can easily	
	be corrected through sensitization and capacity building forums for end	
	users to be made aware of the best practices that should be used when	
	handling herbicides. There has been reports of increase of chronic	
	diseases in human beings resulting from pesticide exposure.	
<b>B:</b> Assessment of disser	nination and scaling up/out approaches

upscaling if any	• Chances of successful scaling are higher when diverse value channels stakeholders collaborate in an innovation platform
upscaring it any	Creation of avarances through demonstrations and former field days
	• Creation of awareness through demonstrations and farmer field days
	A suitability of meriod is accordial
	• Availability of market is essential
	• Partnership is important in technology dissemination and adoption
	and this can be facilitated through innovation platforms
	• Consumers concerns of herbicide residues in the soil and subseguent
	crops needs attention
	• Upscaling of this technology needs young men and youth due to its
	hazardous nature. Some of the aspects of this technology need a lot
	of capital to actualize. For instance, the collection and incineration
	of pesticide containers needs a lot of money that may not be
	accessible by most men or youth groups.
	• The illiteracy levels of some farmers may hinder the use of correct
	Information/knowledge in the use of herbicides in some areas.
Social, environmental,	Organized collective marketing channels critical for benefits to be
policy and market	derived from practice

## 2.9 Green Gram Post Harvest Management

2.9.1 TIMP	Name		Harvesting
Category	(i.e.	technology,	Management Practice
innovation or management practice)		ment practice)	

A: Description of the technology, innovation or management practice		
Problem to be addressed	Losses due to incorrect timing of harvest and inappropriate	
	harvesting methods.	
What is it? (TIMP description)	This is a management practice involving careful maturity indices,	
	pre-harvest operations and actual harvesting procedure.	
	Maturity indices and correct time for harvesting Green grams should be harvested at the physiological maturity, i.e. when 95% of the pods have fully matured, and turned black and dry. During this time, pods are thin and brittle and hence shattering is not a problem during harvesting. This also ensures optimum grain quality and consumer acceptance.	
	Harvesting Harvesting of green grams is done either manually or by machines (combine harvester). Manual harvesting: When harvesting is done manually, green gram stalks may be cut with a hand saw, or sickle; or uprooted. Alternatively, mature pods may simply be handpicked. The harvested bundles should be kept in one direction to facilitate efficient threshing. They should be stacked in a dry, clean place to facilitate circulation of air around. Manual harvesting of green grams in Kitui (Source: Philip Muasya, <i>Standard</i> )	
	<b>Mechanical harvesting:</b> For mechanical harvesting, the plants should defoliate (using defoliants / or desiccants) and dry before harvesting. Seed splitting and damage during harvesting can be minimized by harvesting the crop at the optimum moisture content (14 to 16%), avoid harvesting during the noon when temperatures are too high, and by proper harvest settings.	
Justification	Incorrect timing of harvesting and inappropriate harvesting methods leads to losses of green grams. Harvesting before the maturity of the crop results in lower yields, higher proportion of	

	immature seeds, poor grain quality and more chances of pest infestation during storage. Delayed harvesting results in shattering of pods and losses caused by birds, rats and insects. Correct timing of harvest reduces these losses.	
B: Assessment of dissemination and	l scaling up/out approaches	
Users of TIMP	Farmers, traders and extension agents	
Approaches used in dissemination	On-farm experimentation and demonstration, Farmer Field and Business Schools, Farmer Innovation Platforms (FIPs), field days, leaflets	
Critical/essential factors for successful promotion	Participatory implementation, stakeholder capacity building and networks, promotions involving Public Private Partnerships (PPP); increased production of high-quality green grams, availability of quality standards	
Partners/stakeholders for scaling up and their respective roles	<ul> <li>Farmers and farmer groups – Provide land for demonstration plots; labour; manage trials; keep records to be used in M&amp;E</li> <li>County government and private extension service providers will train farmers on correct maturity indices and appropriate harvesting procedures. They will also offer advice and collect information on the uptake and practice on the technology</li> <li>KALRO – will train trainers and provide technical backstopping on dissemination of maturity indices and appropriate harvesting procedure.</li> </ul>	
C: Current situation and future sca	ling up	
Counties where already promoted, if any	Kitui, Machakos, Baringo	
Counties where TIMPs will be upscaled	Machackos	
Challenges in development and dissemination	<ul> <li>Lack of knowledge on maturity and appropriate harvesting technology</li> <li>Negative attitude by farmers towards adoption of new agricultural TIMPs</li> </ul>	
Suggestions for addressing the challenges	<ul> <li>Awareness creation about the TIMP to farmers</li> <li>Capacity building of farmers on the TIMP</li> <li>Availing data on economics and the gains to be made through adoption of the TIMP</li> </ul>	
Lessons learned in up scaling, if any	<ul> <li>Involvement of stakeholders such as CBOs and NGOs enhances adoption</li> <li>Continuous capacity building is key to attitude change.</li> <li>Consistent trainings, demonstrations and sensitisations would motivate farmers to adopt the TIMP</li> </ul>	
Social, environmental, policy and market conditions necessary for development and up-scaling	<ul> <li>Farmers are willing to adopt the technology</li> <li>There is favourable policy for adoption of the technology</li> <li>conditions: The market absorb saved grain from reduced harvesting losses</li> </ul>	
D: Economic, gender, vulnerable and marginalized groups (VMGs) considerations		
Basic costs	Labour for harvesting	
Estimated returns	Not yet estimated	

Gender issues and concerns in development, dissemination, adoption and scaling up	<ul> <li>Women have limited access to productive resources such as land, credit facilities and equipment</li> <li>In the target counties, green gram cultivation is mainly done by women increasing their work burden</li> <li>Women loss their crops due to late harvesting as a result of being overworked</li> <li>Women have no finances to pay for hired labor due to limited access to credits</li> <li>Women are exploited by middle men and brokers due to limited market information and extension</li> </ul>
	• The TIMP is easily adoptable after training and many farmers can use the technology since it reduces losses incurred during and after harvesting.
Gender related opportunities	<ul> <li>The TIMP increases farm income through reduction of postharvest losses.</li> <li>There is increased employment for women and youth</li> <li>There is increased food security and nutrition for households</li> </ul>
VMG issues and concerns in development and dissemination, adoption and scaling up	<ul> <li>It is labor intensive for some VMGs especially the PLWD and the sick.</li> <li>VMGs lack access to information on new technologies and information</li> <li>VMGs have no finances due to limited access to credit facilities</li> <li>Mechanical harvesting can be encouraged to all gender, including the VMGs.</li> </ul>
VMG related opportunities	<ul> <li>Adoption of the TIMP means reduced postharvest losses,</li> <li>This will enable VMGs to have enough green gram to consume, hence get macro- and micronutrients (especially minerals)</li> <li>More income for the farmers (VMGs)</li> </ul>
E: Case studies/profiles of success s	tories
Success stories	Farmers in Kitui and Machakos have adopted the technology
Application guidelines for users <b>F: Status of TIMP Readiness</b> (1. Ready for up scaling; 2. Requires validation; 3. Requires further research)	Green gram harvesting leaflets, factsheets and manuals Requires validation

## GAPS

- Quantification of the losses due to incorrect timing of the right maturity for harvesting different green gram varieties
- Quantification of losses of manual vs. mechanical green gram harvesting, including the cost-benefit analyses of each method

<b>2.9.2. TIMP name</b>	Tarpaulins for drying of green gram pods before threshing
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technolo	by, innovation or management practice
Problem addressed	Yield loss due to fungal infestation and inefficient threshing
	from inefficiently dried grain
What is it? (TIMP	The management practices involves drying of the pods on a
description)	tarpaulin (mats) until they are ready for threshing. This avoids
	contamination of the grain during drying, hence minimizing
	Thytotoxin containing of the gran.
	Fry pods ready for threshing (Source: F. Wayua)
Justification	Well dried pods enhance threshing efficiency and food safety of
	the grain
B: Assessment of dissemination	on and scaling up/out approaches

Users of TIMP	Farmers and extension agents	
Approaches to be used in	Farmer training and demonstrations, farmer field days, extension	
dissemination	publications, agricultural shows and exhibitions, extension	
	publications	
Critical/essential factors for	• Existence of effective extension services to demonstrate the	
successful promotion	technology	
	• Accessibility and cost of the tarpaulins by farmers	
	• Funding to promote the tarpaulins	
Partners/stakeholders for	• Extension service providers to help in the dissemination	
scaling up and their roles	• NGOs (e.g. One-Acre Fund) to help in technology	
	dissemination through on-farm demonstrations: capacity	
	building of farmers, availability of tarpaulins	
	• Private sector e g agro-dealers to avail tarpaulins close to	
	farmers	
	• County governments – to help in the dissemination of the	
	technology	
C: Current situation and futu	re scaling un	
Counties where already	Machakos Kitu Kakamega Bungoma	
promoted, if any	Thurnanos, Thur, Thurantogu, Dangonna	
Counties where TIMPs will	Isiolo, Machakos, Taita Tayeta, Tharaka Nithi, West Pokot,	
be upscaled	Baringo. Tana River	
Challenges in dissemination	• Lack of local availability of tarpaulins close to farmers	
	• Lack of funds to procure the tarpaulins	
Suggestions for addressing	• Adopting public-private-partnerships so that the private	
the challenges	sector (e.g. NGOs agro-vets etc.) can stock the tarnaulins	
	closer to farmers	
	• Availing appropriate credit facilities to farmers to enable	
	acquisition of tarpaulins	
Lessons learned in up scaling,	Up-scaling is enhanced through partnership technology	
if any	dissemination, extension training and regular monitoring, and	
	availing the tarpaulins within easy reach of farmers	
Social, environmental, policy	• Farmers are willing to adopt the technology	
and market conditions	• Policies to encourage supply of tarpaulins within easy reach	
necessary for development	to farmers are implemented	
and up scaling	• Market is able to absorb increased supply of grain	
D: Economic, gender, vulnerable and marginalized groups (VMGs) considerations		
Basic costs	KES 5,000/- per tarpaulin	
Estimated returns	Reduced postharvest losses	
Gender issues and concerns in	• Women have limited access to productive resources such as	
development, dissemination	land, credit facilities and equipment	
adoption and scaling up	• In the target counties, green gram cultivation is mainly done	
	by women increasing their work burden	
	• Women loss their crops due to inefficient drying methods due	
	to lack of tarpaulins	
	• Women have no finances to pay for tarpaulins due to limited	
	access to credits	
	• The TIMP is easily adoptable after training, providing	
	appropriate credit facilities and availing the tarpaulins to local	

	agro-dealers; many farmers can use the technology since it reduces losses incurred during drying
Gender related opportunities	<ul> <li>Opportunities for youth, women and VMGs in marketing tarpaulins</li> <li>The TIMP increases farm income through reduction of postharvest losses, hence increased food security and nutrition for households.</li> <li>The TIMP also enhances food safety by preventing contamination of the harvested produce during drying</li> </ul>
VMG issues and concerns in development, dissemination adoption and scaling up	<ul> <li>It is labor intensive for some VMGs especially the PLWD and the sick.</li> <li>VMGs lacks access to information on new technologies and information</li> <li>VMGs have no finances due to limited access to credit facilities</li> <li>Tarpaulins can be encouraged to all gender, including the VMGs.</li> </ul>
VMG related opportunities	<ul> <li>Adoption of the TIMP means reduced postharvest losses and enhanced food safety</li> <li>The technology can improve food and nutrition security and a window for increased income.</li> <li>Opportunity for VMGs to engage in marketing of tarpaulins</li> </ul>
E: Case studies/profiles of suc	ccess stories
Success stories	Farmers in Kitui, Machakos and Tana River have adopted tarpaulins
Application guidelines for users	Wayua, F., Wasike, V. and Wasilwa, L. (2020). Tarpaulins for drying of green gram pods before threshing. KALRO/KCSAP Programme Factsheet No. #, July 2020
<b>F: Status of TIMP readiness</b> (1-Ready for upscaling, 2- requires validation, 3-requires further research)	1-Ready for upscaling
G: Contacts	
Contacts	Centre Director, KALRO Kakamega P.O. Box 169-50100, Kakamega Email: <u>kalro.kakamega@kalro.org</u> or <u>director.nrri@kalro.org</u> Tel. 05620-30031/30039
Lead organization and scientists	KALRO: Francis Wayua., Victor Wasike, Francis Wayua
Partner organizations	Extension service providers, CGIAR's, NGOs, County governments

2.9.3 .TIMP name	Threshing of green gram pods (Multipurpose Legume Thresher)
Category (i.e. technology, innovation	Technology
or management practice)	
A: Description of the technology, inno	vation or management practice
Problem addressed	Postharvest losses due to inefficient threshing, breakages
	during manual threshing, and resulting pest infestation of
What is it? (TIMD description)	Diokell grann This is a motorized multinumeses threaker for threaking
what is it? (Thim description)	green grams, common dry beans and pigeon peas.
Instification	Multipurpose legume thresher (Source: Wayua)
Justification	The multipurpose legume thresher is fast and efficient,
	does not contaminate the threshed grain with soil, and has
	minimal breakages, hence better quality
<b>B:</b> Assessment of dissemination and se	caling up/out approaches
Users of TIMP	Farmers, traders and extension agents
Approaches to be used in	On-farm demonstrations, Farmer Field and Business
dissemination	Schools, farmer field days, exhibitions, and agricultural
	shows, farmer training, extension publications
Critical/essential factors for successful	• County and Central Government support
promotion	• Funding to promote the threshers
	• Existence of effective extension services to
	demonstrate the technology
	• Strong partnership linkages
Partners/stakeholders for scaling up	• Extension service providers to help in the
and their roles	dissemination
	• NGOs e.g. Agricultural Technology Development
	Centre (ATDC) - Katumani, and Bukura) to fabricate
	the threshers, and disseminate to farmers through on-
	tarm demonstrations; capacity building of farmers,
	• KIKDI - to fabricate the threshers, and disseminate to
	building of formers
	County governments to help in the discomination of the
	technology
C: Current situation and future scalin	ng up

Counties where already promoted, if	Kitui
Counties where TIMPs will be	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West
upscaled	Pokot, Baringo, Tana River
Challenges in dissemination	• Lack of local availability of threshers
e	• Lack of knowledge on the technology
Suggestions for addressing the challenges	<ul> <li>Adopting public-private-partnerships, so that the private sector (e.g. NGOs) can fabricate the threshers closer to farmers</li> <li>Capacity building of farmers on the technology</li> </ul>
Lessons learned in up scaling, if any	<ul> <li>Partnership is important in technology dissemination</li> <li>Extension training and regular monitoring are essential in up-scaling</li> </ul>
Social, environmental, policy and market conditions necessary for development and up scaling	<ul> <li>Farmers will be willing to adopt the technology</li> <li>Policies to encourage local fabrication of threshers are implemented</li> <li>The market is able to absorb increased supply of grain</li> </ul>
• D: Economic, gender, vulnerable an	d marginalized groups (VMGs) considerations
Basic costs	• KES 120,000/-
Estimated returns	<ul> <li>Breaks labour bottlenecks</li> <li>Slight reduction compared to traditional techniques</li> <li>It also causes less splitting of seeds, low number of seeds left in pods,</li> </ul>
Gender issues and concerns in development, dissemination adoption and scaling up	<ul> <li>Access of funds by women is limited</li> <li>Thresher is expensive for women to afford</li> <li>Women and youth have limited finances to pay services and to purchase farm equipment due to limited access to credit facilities</li> <li>Women have limited access to education, training and extension services than men relating to farm mechanization</li> <li>Men dominate most decisions at the household and community levels hence determines the type of facilities to be used in farms</li> <li>Threshers should be designed for easy start and operation.</li> <li>Up-scaling should target all the gender and they should be affordable to all gender</li> </ul>
Gender related opportunities	<ul> <li>Opportunities for youth in fabrication and repair of threshers, and providing threshing services</li> <li>The motorised thresher is less laborious particularly for women who are mainly the ones doing manual threshing. Time saved can be used in other productive agricultural activities</li> </ul>
VMG issues and concerns in development, dissemination adoption and scaling up	• VMGs have limited finances to pay services and to purchase farm equipment due to limited access to credit facilities

	• Operating a threshing machine is complicated for
	some VMGs especially those who are abled differently
	to operate
	• VMGs need to be equipped with information
	relating to the TIMP
	• Linking the VMG to financial institutions would
	enable them to buy since it is affordable and easy to
	maintain machines
	• Farm machines need to be designed in such a way
	which would enable people able differently to operate
	• In addition they need to be affordable
VMG related opportunities	• Improved nutrition for VMGs - the technology reduce
r	nostharvest losses hence more green grams to be
	consumed and sold
	• Opportunity for VMCs to opgage in fabrication and
	• Opportunity for vivios to engage in faorication and
	· repair of uneshers
E: Case studies/profiles of success sto	ries
Success stories	Farmers in Kitui and Machakos have adopted the
	threshers
Application guidelines for users	Wayua, F., Wasike, V. and Wasilwa, L. (2020). Green
	gram thresher. KALRO/KCSAP Programme Factsheet
	No. #. July 2022

2.9.4 TIMP name	Winnowing
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology, innovation or management practice	
Problem addressed	Poor quality grains
What is it? (TIMP	Dry green gram grains are winnowed to remove chaff, dust, foreign
description)	matter such as stones, broken grains, shrivelled, mouldy, insect
	damaged, rotten discoloured or faded, and any remaining plant
	parts grains. Winnowing is then done using a winnowing tray
	( <i>'uteo'</i> ) to separate the dry grain from the soil matter before sorting.
	Sorting should be properly done as this attracts a better price than
	unsorted green gram grains.

	Winnowing of threshed green gram grains (Source: Lusike Wasilwa)
Justification	Winnowing improves grain quality by removing chaff, dust, foreign
	matter such as stones, broken grains, shrivelled, mouldy, insect
	damaged, rotten discoloured or faded, and any remaining plant
	parts grains. High quality grain enhances fetches better prices.
<b>B:</b> Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Farmers, traders, extension agents
Approaches to be used in	Extension publications, on-farm demonstrations, farmer training
dissemination	
Critical/essential factors for	• Existence of effective extension services to demonstrate the
successful promotion	technology
	Strong partnership linkages
Partners/stakeholders for	• Extension service providers to help in the dissemination
scaling up and their roles	• NGOs to help in technology dissemination through on-farm demonstrations; and capacity building of farmers
	<ul> <li>County governments – to help in the dissemination of the</li> </ul>
	technology
C: Current situation and futu	re scaling up
Counties where already	Kitui, Machakos
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	Lack of incentives for producing clean green gram grain
Suggestions for addressing	Proving incentives for farmers and traders who produce and sell
the challenges	clean green gram grains
Lessons learned in up scaling,	Extension training and regular monitoring are essential
if any	
Social, environmental, policy	• Regulatory bodies e.g. KEBS ensure traders selling cleaner
and market conditions	grain are certified and appreciated for their efforts
necessary for development	• Favourable policy, encouraging better prices for clean grain
and up scaling	• Existing and new markets are developed and maintained
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	Labour for winnowing
Estimated returns	Higher income and better nutrition from clean grains

Gender issues and concerns in development, dissemination adoption and scaling up	<ul> <li>The TIMP improves grain quality, hence more income for women and youth</li> <li>In the target counties, green gram winnowing is mainly done by women increasing their work burden</li> <li>Women have no finances to pay for hired labor due to limited access to credits</li> <li>The TIMP is easily adoptable after training and many farmers can use it since it improves grain quality</li> </ul>
Gender related opportunities	<ul> <li>The TIMP increases farm income through enhancing grain quality</li> <li>There is increased food security and nutrition for households</li> <li>There is more employment for women and youth</li> </ul>
VMG issues and concerns in development, dissemination adoption and scaling up	<ul> <li>Winnowing is labor intensive for some VMGs especially the PLWD and the sick.</li> <li>VMGs lacks access to information on new technologies and information</li> <li>VMGs have no finances due to limited access to credit facilities to hire labor</li> </ul>
VMG related opportunities	<ul> <li>Adoption of the TIMP means clean grain which fetches better prices, hence improving food and nutrition security and income</li> <li>This will enable VMGs to have enough green gram to consume, hence get macro- and micronutrients (especially minerals</li> </ul>
E: Case studies/profiles of suc	ccess stories
Success stories	Farmers in major grain growing areas have adopted the winnowing technology
Application guidelines for users	Wayua, F., Wasike, V. and Wasilwa, L. (2020). Green gram winnowing. KALRO/KCSAP Programme Factsheet No. #. July 2022
<b>F: Status of TIMP readiness</b> (1-Ready for upscaling, 2- requires validation, 3-requires further research)	1-Ready for upscaling

<b>2.9.5. TIMP name</b>	Mechanized solar drying of threshed green gram grains
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technology	pgy, innovation or management practice
Problem addressed	Postharvest loss due to mycotoxin contamination of inefficiently
	dried grain
What is it? (TIMP	Drying of threshed grains can be done in open sunshine, or in
description)	mechanised solar dryers and electricity powered dryers, which are
	fast and efficient. Drying of threshed grain involves reducing the
	moisture content to 10%, which is important for safe storage
	Diesel powered grain dryer in Kitale, Kenya (Source: Wayua)
	Greenhouse solar dryer for agricultural produce (Source: Wayua)
	The grains should be dried to a moisture content of 10% which is
	important for safe storage. Use a moisture meter for accurate
	determination of moisture content.
Justification	Well dried grains eliminates mycotoxin contamination of the grain
<b>D.</b> A granger 4 - <b>f</b> 1'	and is important for safe storage.
<b>D:</b> Assessment of dissemination	on and scaling up/out approaches
Users of 11MP	Farmers, traders, processors, extension agents, research organizations and universities
Approaches to be used in	On-farm demonstrations, farmer training, extension publications.
dissemination	agricultural shows and exhibitions, farmer field days
Critical/essential factors for	• Existence of effective extension services to demonstrate the
successful promotion	technology

	Strong partnership linkages
	• Funding to promote the driers
Partners/stakeholders for	• Extension service providers (Public and private) to help in the
scaling up and their roles	dissemination
	• CGIAR's
	• NGOs): technology dissemination through on-farm
	demonstrations; capacity building of farmers, availability of
	solar dryers
	• County governments –Help in the dissemination of the
	technology
	• Financial institutions – provide credit to farmers to enable
	acquisition of the drying machines
C: Current situation and futu	re scaling up
Counties where already	Busia, Trans Nzoia, Kisii
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	Lack of local availability of dryers
Suggestions for addressing	Adopting public-private-partnerships, so that the private sector
the challenges	can stock the dryers closer to farmers and charge a fee for their
	usage
	Farmer groups to be given affordable credit facilities to acquire
<b>T 1 1 1 1</b>	the solar dryers
Lessons learned in up scaling,	The technology is more appropriate to large scale farmers. Small-
11 any	scale farmers can pool their grain to use and benefit from the
Social anyironmental policy	technology
and market conditions	• Additive of farmers to pool their grain for drying in the driefs
necessary for development	• The market is able to absorb increased supply of gram
and up scaling	• Favourable policy, encouraging better prices for properly-dried
D: Economia gondor vulnors	glalli ble and marginalized groups (VMCs) considerations
<b>D. Economic, genuer, vumera</b> Basic costs	This includes costs of hiring the drier, and fuel for drying
Estimated returns	Reduced losses as a result of properly dried grain
Gender issues and concerns in	• In the target counties, green green winneying is mainly done by
development dissemination	• In the target counties, green grann winnowing is manny done by women increasing their work burden
adoption and scaling up	• Women have no finances to pay for hired labor due to limited
adoption and searing up	• women have no mances to pay for fined fabor due to minited
	• The TIMP is easily adoptable after training and many farmers
	can use it since it improves grain quality
	<ul> <li>Access to funds by women is limited</li> </ul>
	<ul> <li>Use of drivers will not overburden any gender in implementation</li> </ul>
	and therefore have potential for adoption by both gender.
Gender related opportunities	• Offers employment for the youth in offering grain drying
	services
	• The dryers improves grain quality, hence more income for
	women and youth
	• It makes work easy for women and it enhances equitable
	distribution of labour

	• Improves food security and nutrition for households
VMG issues and concerns in development, dissemination adoption and scaling up VMG related opportunities	<ul> <li>VMGS have no finances to pay for hired labor due to limited access to credits</li> <li>VMGs have limited access to agricultural information on new technologies and innovations</li> <li>VMGs due to their status are ignored when important decisions are being made relating to farming</li> <li>The technology can improve food and nutrition security and a window for increased income for VMGs</li> </ul>
	<ul> <li>The dryers improves grain quality, hence more income for women and youth</li> <li>It makes work easy for VMGs</li> <li>Improves food security and nutrition for households</li> </ul>
E: Case studies/profiles of suc	ccess stories
Success stories	Farmers in Kitui and Machakos have adopted the dryers
Application guidelines for users	Wayua, F., Wasike, V. and Wasilwa, L. (2020). Drying of threshed green grams. KALRO/KCSAP Programme Factsheet No. #, July 2020
F: Status of TIMP readiness	1-Ready for upscaling
(1-Ready for upscaling, 2-	
requires validation, 3-requires	
further research)

2.9.6 TIMP name	Moisture meter for green gram moisture determination
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technology, innovation or management practice	
Problem addressed	High postharvest losses and mycotoxin contamination due to
	inappropriately dried grains
What is it? (TIMP	This is a portable electronic machine for accurate measuring the
description)	moisture content of threshed green gram and other food grains.
	Threshed grain is placed inside the bowl of the moisture meter, and
	the reading taken after 1-2 minutes. The grains should be dried to a
	moisture content of 10% which is important for safe storage.

	Maiatura matar (Sourae) Mayagala at al. 2017)
Justification	Drying and storage challenges are the two main postharvest problems faced by green gram farmers in Kenya after harvesting their produce. Inappropriate drying leads to mycotoxin contamination of the grain in storage. Inappropriately dried grain will not mill correctly during processing and value addition. The moisture meters enable farmers to accurately know when their grain is dry enough to the recommended moisture content for storage (10%), hence preventing mycotoxin contamination and postharvest
	the grain and is important for safe storage.
<b>B:</b> Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Farmers, traders, extension agents, research organizations and universities, Government (e.g. National Cereals and Produce Board)
Approaches to be used in dissemination	Extension publications, on-farm demonstrations, agricultural shows and exhibitions farmer field days and farmer training
Critical/essential factors for successful promotion	<ul> <li>Existence of effective extension services to demonstrate the technology</li> <li>Accessibility and cost of the tarpaulins by farmers</li> <li>Funding to promote the tarpaulins</li> </ul>
Partners/stakeholders for scaling up and their roles	<ul> <li>Extension service providers to help in the dissemination</li> <li>NGOs to help in technology dissemination through on-farm demonstrations; capacity building of farmers, availability of grain moisture meters</li> <li>Private sector e.g. agro-dealers to avail grain moisture meters close to farmers</li> <li>County governments – to help in the dissemination of the technology</li> </ul>
C: Current situation and future scaling up	
Counties where already promoted, if any	Kakamega, Busia, Trans Nzoia, Kisii, Tharaka Nithi, Machakos, Embu, Kakamega
Counties where TIMPs will	Isiolo, Machakos, Taita Tayeta, Tharaka Nithi, West Pokot
be upscaled	Baringo, Tana River
Challenges in dissemination	<ul> <li>Lack of local availability of grain moisture meters close to farmers</li> </ul>
	• Lack of funds to procure the moisture meters

Suggestions for addressing	• Availing the devices locally through agro-dealers and other
the challenges	private sector entrepreneurs
	• Farmer groups to be given affordable credit facilities to acquire
	the grain moisture meters
Lessons learned in up scaling,	Up-scaling is enhanced through partnership technology
if any	dissemination, extension training and regular monitoring, and
	availing the moisture meters within easy reach of farmers
Social, environmental, policy	- Farmers willingness to adopt the technology
and market conditions	- Market able to absorb increased supply of grain
necessary for development	- Policies to encourage supply of moisture meters within easy
and up scaling	reach to farmers are implemented
	- Favourable policy, encouraging better prices for well-dried
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	KES 50 000/ per piece
Estimated returns	Reduced losses hence higher returns and enhanced nutrition
Gender issues and concerns in	• Women have limited access to productive resources such as
development, dissemination	land, credit facilities and equipment
adoption and scaling up	• In the target counties, green gram cultivation is mainly done by
	women increasing their work burden
	• Women loss their crops due to inefficient drying methods due
	to lack of reliable apparatus to test when their grain is dry
	enough for safe storage
	• Women have no finances to pay for moisture meters due to
	limited access to credits
	• The TIMP is easily adoptable after training, providing
	appropriate credit facilities and availing the moisture meters to
	local agro-dealers; many farmers can use the technology since
	it reduces losses incurred due to incorrect detection when
	drying is complete
Gender related opportunities	• Opportunities for youth, women and VMGs in selling moisture
	meters
	• The TIMP increases farm income through reduction of
	postharvest losses, hence increased food security and nutrition
	The TDAD also as here a final as fater has a more than the second s
	• The TIMP also enhances food safety by preventing mycotoxin
	detection methods of the correct drying parameter
VMG issues and concerns in	• VMGs looks access to information on now technologies and
development dissemination	• VMOS lacks access to information on new technologies and information
adoption and scaling up	• VMGs have no finances due to limited access to credit facilities
adoption and searing up	<ul> <li>VMGs have limited access to agricultural information on new</li> </ul>
	technologies and innovations
	• VMGs due to their status are ignored when important decisions
	are being made relating to farming
	• Moisture meters can be encouraged to all gender, including the
	VMGs.
VMG related opportunities	• Adoption of the TIMP means reduced postharvest losses and
	enhanced food safety

E. Coso studios/musfiles of suc	<ul> <li>The technology can improve food and nutrition security and a window for increased income.</li> <li>Opportunity for VMGs to engage in marketing of moisture meters</li> </ul>

<b>2.9.7. TIMP name</b>	De-stoning machine
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technology	ogy, innovation or management practice
Problem addressed	Low quality and food safety risks due to presence of stones, glass, metal particles and other physical contaminants in green grams
What is it? (TIMP	This is a machine which removes stones, glass, metal particles and
description)	other physical contamination from green gram grains, using
	vibration and fluidized air.
	Destoning machine

Justification	The machine removes stones from the green grams, hence
<b>B</b> : Assossment of dissomination	guaranteeing safety and quanty of the produce, hence better prices
<b>D.</b> Assessment of dissemilation	Earmer groups and cooperatives traders industrial processors
Approaches to be used in	Field days exhibitions agricultural shows trainings and
dissemination	promotional materials (posters/brochures/leaflets)
Critical/essential factors for	• Ideal for commercial green gram production and marketing
successful promotion	(large scale producers). For small-scale operations, the stones
Ĩ	and physical contaminants can be removed during winnowing.
	<ul> <li>County and central government support</li> </ul>
	• Funding to promote the varieties
Partners/stakeholders for	NGOs / CBOs to help in the dissemination
scaling up and their roles	• Traders and industrial processors to adopt the technology
	• Financial institutions – provide credit to value chain actors to
	enable acquisition of the de-stoners
C: Current situation and futu	re scaling up
Counties where already	None
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	• Lack of information and skills on the technology
	Lack of funds to acquire de-stoners
Suggestions for addressing	• Capacity building of farmers, traders and extension agents
the challenges	• Provide appropriate financial services and credit facilities to
	small-scale farmers and traders
Lessons learned in up scaling,	Up-scaling is enhanced through partnership, extension training and
if any	regular monitoring, and availing the machines within easy reach of
	farmers, traders and processors
Social, environmental, policy	- Ideal for large scale green gram production and industrial
and market conditions	- Value chain actors willingness to adopt the technology Market able to absorb increased supply of grain
and up scaling	- Market able to absorb increased supply of grain Policies to ancourage supply of destoning machine within easy
and up scamg	- Foncies to encourage suppry of destoring machines within easy reach to farmers are implemented
	- Favourable policy encouraging better prices for higher quality
	grain
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	Not yet determined
Estimated returns	Better prices from higher quality grain
Gender issues and concerns in	Women have limited access to funds
development, dissemination	• Women have limited access to productive resources such as
adoption and scaling up	land, credit facilities and equipment
	• In the target counties, green gram work is mainly done by
	women increasing their work burden
	• Women loss their crops due to inefficient post-harvest methods
	due to lack of reliable apparatus to remove stones
Gender related opportunities	Opportunities for youth to engage in commercial production of
Gender related opportunities	oreen grams, and also in offering grain de-stoping services to
	value chain actors

	Improved quality of grains
	Improved incomes for youth and women
VMG issues and concerns in	Financial constraints to VMGs
development, dissemination	• VMGs lacks access to information on new technologies and
adoption and scaling up	information
	• VMGs have no finances due to limited access to credit facilities
	<ul> <li>VMGs have limited access to agricultural information on new technologies and innovations</li> </ul>
	• VMCs due to their status are ignored when important decisions
	are being made relating to farming
VMG related opportunities	The technology can improve food and nutrition security and a
	window for increased income.
	Opportunities for youth to engage in commercial production of
	green grams; and also in offering grain de-stoning services to
	value chain actors
	Improved quality of grains
	Improved incomes for youth and women
E: Case studies/profiles of suc	cess stories
Success stories	Large scale traders and industrial processors in major cities are
	using the technology
Application guidelines for	Wayua, F., Wasike, V. and Wasilwa, L. (2020). De-stoning
users	machine. KALRO/KCSAP Programme Factsheet No. #, July 2020

2.9.8 TIMP name	Purdue Improved Crop Storage (PICS) Hermetic Bags
Category (i.e. technology,	Technology
innovation or management	
practice)	
A: Description of the technology, innovation or management practice	
Problem addressed	High postharvest losses of food grains
What is it? (TIMP	This is gunny bag with two inner polythene linings. Dry green gram
description)	(10% moisture content) to be stored is put inside the inner polythene
	bag which is then tied air-tight. The second polythene is also tied
	air-tight, followed by tying the outer gunny bag cover. This is a

	abamical free starses of dry group grow and other food grains. The
	chemical-free storage of dry green gram and other food grains. The
	PICS bags is very effective in keeping off green gram storage pests,
	the main one being bean bruchid. Grain can keep over one year
	inside the hermetic bags, if kept in a cool dry place, and other
	destructive agents e.g. rodents are kept at bay.
	Proved Crop Storage (PICS) Hermetic Bags (Source: Wayua)
Justification	Pests can cause crop loss of up to 100%. PICS bags prevents
	bruchid infestation during storage, and increase shelf life of green gram and food grains along the value chain through hermetic storage. This will increase income of farmers and traders. The PICS hermetic bags are chemical-free crop storage, hence safer to use.
<b>B:</b> Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Farmers, traders, processors, Government agencies (e.g. National
	Cereals and Produce Boards)
Approaches to be used in	On-farm demonstration, field days, exhibitions, agricultural shows,
dissemination	trainings and promotional materials (posters/brochures/leaflets)
Critical/essential factors for	• Existence of effective extension services to demonstrate the
successful promotion	technology
F	• Accessibility and cost of the hermetic hags to farmers
	<ul> <li>Funding to promote the hermetic bags</li> </ul>
Partnars/stakaholdars for	Funding to promote the hermetic bags
scaling up and their roles	• Extension service providers to help in the dissemination
scaling up and then toles	• NGOs and agro-dealers to help in technology dissemination
	through on-farm demonstrations; capacity building of farmers,
	availability of hermetic bags
	• Private sector e.g. agro-dealers to avail tarpaulins close to
	• County covernments to help in the discomination of the
	technology
	Einensiel institutions musuide gradit to formers to enchle
	• Financial institutions – provide credit to farmers to enable acquisition of the hermetic bags
C: Current situation and futu	re scaling un
Counties where already	Busia Trans Nzoia Kisii Tharaka Nithi Machakos Embu
promoted if any	Kakamega
Counties where TIMPs will	Isiolo Machakos Taita Taveta Tharaka Nithi West Pokot
be unscaled	Baringo Tana River
Challenges in dissemination	• Lack of local availability of hermetic bags close to farmers
	• Lack of funds to procure the hermatic bags
Suggestions for addressing	<ul> <li>Lack of funds to produce the hermetic bags</li> <li>Adopting public private partnershing on that the private partnershing</li> </ul>
the challenges	• Adopting public-private-partnerships, so that the private sector
	to farmers

	• Availing appropriate credit facilities to farmers, traders and
	processors to enable acquisition of hermetic bags
Lessons learned in up scaling,	The major outcome of PICS bags was a change in marketing
if any	behavior: farmers sell later, at 5 months after harvest, increasing
	their income. Up-scaling is enhanced through partnership
	technology dissemination, extension training and regular
	monitoring, and availing the tarpaulins within easy reach of
	farmers.
Social, environmental, policy	- Policies to encourage supply of hermetic bags within easy
and market conditions	reach of farmers are implemented
and up agaling	- Favourable policy, encouraging better prices for high quality
and up scamg	grain Market able to absorb increased supply of grain
D. Economic gender vulners	- Market able to absolutilitetased supply of grain
<b>D. Economic, gender, vumera</b> Basic costs	- KES 300/2 per PICS bag
Estimated returns	- KLS 500/- per l ICS bag Reduces postharvest losses by 100%
Gender issues and concerns in	• Women have limited access to productive resources such as
development dissemination	• Women have minied access to productive resources such as land, credit facilities and equipment
adoption and scaling up	In the target counties, green gram cultivation is mainly done by
adoption and searing up	women increasing their work burden
	• Women loss their crons due to inefficient storage methods due
	to lack of hermetic bags
	<ul> <li>Women have no finances to pay for hermetic bags due to limited</li> </ul>
	access to credits
	• The TIMP is easily adoptable after training providing
	appropriate credit facilities and availing the hermetic bags to
	local agro-dealers: many farmers can use the technology since
	it reduces losses incurred during storage
Gender related opportunities	• Opportunities for youth in selling PICS bags to farmers and
	traders
	• The TIMP increases farm income through reduction of
	postharvest losses and enhancing food safety, hence increased
	food security and nutrition for households.
VMG issues and concerns in	• VMGs lacks access to information on new technologies and
development, dissemination	information
adoption and scaling up	• VMGs have no finances due to limited access to credit facilities
	• VMGs due to their status are ignored when important decisions
	are being made relating to farming
VMG related opportunities	• Adoption of the TIMP means reduced postharvest losses and
	enhanced food safety
	• The technology can improve food and nutrition security and a
	window for increased income.
	• Opportunity for VMGs to engage in marketing of hermetic bags
E: Case studies/profiles of suc	cess stories
Success stories	The technology is widely used in major grain growing areas of
	Kenya

Application guidelines for	Wayua, F., Wasike, V. and Wasilwa, L. (2020). Purdue Improved
users	Crop Storage (PICS) Hermetic Bags. KALRO/KCSAP Programme
	Factsheet No. #, July 2020
F: Status of TIMP readiness	1-Ready for up-scaling
(1-Ready for upscaling, 2-	
requires validation, 3-requires	
further research)	
G: Contacts

	governments

2.9.9 TIMP name	Green gram stores
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology	ogy, innovation or management practice
Problem addressed	High postharvest storage losses of food grains
What is it? (TIMP	The TIMP includes a storage structure for storage of the grains in
description)	hermetic bags. The storage structure ensures that the hermetic bags
	are not attacked by rodents, and maintains the quality of the grain.
	The store can adopt acoustic technology to monitor and control
	insect infestation of the store. Practice First In First Out (FIFO)
	principle in stock management.
Justification	The TIMP reduces losses by maintaining the quality of stored grain
	and ensures a steady supply of grain. This enables farmers to bulk
	green grams during harvest season and sell the grains during the off
	seasons at higher prices.
B: Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Farmers, traders, industrial and commercial processors
Approaches to be used in	On-farm demonstration, exposure visits, trainings and promotional
dissemination	materials (posters/brochures/leaflets)
Critical/essential factors for successful promotion	• Existence of functional institutional arrangements and market linkages
	Accessibility and cost of grain storage structures to farmers

	Funding to promote the grain stores
Partners/stakeholders for	• Extension service providers (Public and private) to help in the
scaling up and their roles	dissemination
	• NGOs / CBOs
	• National and County governments (e.g. NCPB) to help in the
	dissemination
	• Financial institutions to provide credit for constructing grain
	stores
C: Current situation and futu	re scaling up
Counties where already	Major grain growing areas of Kenya
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	• Lack of information and skills to operate grain stores
	Lack of credit to construct stores
Suggestions for addressing	• Capacity building of farmers, traders and extension agents
the challenges	• Provide appropriate financial services and credit facilities to
	small-scale farmers, traders and processors
Lessons learned in up scaling,	• Partnership is important in technology dissemination
if any	• Extension training and regular monitoring are essential
Social, environmental, policy	- Existence of functional institutional arrangements
and market conditions	- Market able to absorb increased supply of grain
necessary for development	- Policies for grain stores are implemented
and up scaling	
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	Yet to be determined
Estimated returns	Reduced losses, increased shelf-life and hence more income from
	grain sales
Gender issues and concerns in	• Women have limited access to productive resources such as
development, dissemination	land, credit facilities and equipment
adoption and scaling up	• In the target counties, green gram cultivation is mainly done by women increasing their work burden
	• Women have limited access to agricultural information and extension
	• Women have been experiencing post-harvest losses due
	<ul> <li>men loss their crops due to inefficient storage methods</li> </ul>
	<ul> <li>Women have no finances to construct and operate grain stores.</li> </ul>
	due to limited access to credits
Gender related opportunities	Opportunities for youth in setting and operating grain stores
Sender Teluced opportunities	Improved quality of seeds
	Reduction of post- harvest losses due to poor storage
VMG issues and concerns in	• VMGs have limited access to productive resources such as land.
development, dissemination	credit facilities and equipment
adoption and scaling up	• VMGs have limited access to agricultural information and
	extension
	• VMGs have been experiencing post-harvest losses due due
	to inefficient storage methods

	• VMGs have no finances to construct and operate grain stores due to limited access to credits The management practices reduce postharvest losses, hence more green grams to be consumed and sold
VMG related opportunities	• The technology helps in conserving green grams, hence contributing to food security for VMGs; and enabling sales of green grams during off seasons when prices are higher
E: Case studies/profiles of suc	ccess stories
Success stories	Grain stores have been adopted by farmers, traders and processors in major green gram producing and processing areas of Kenya
Application guidelines for	Wayua, F., Wasike, V. and Wasilwa, L. (2020). Green gram stores.
users	KALRO/KCSAP Programme Factsheet No. #, July 2020

## 2.10 Green gram Processing and Value Addition

2.10.1 TIMP name	Green gram flour
Category (i.e. technology,	Innovation
innovation or management	
practice)	
A: Description of the technology	ogy, innovation or management practice
Problem addressed	Limited utilisation of green grams
What is it? (TIMP	Flour prepared from green grams
description)	EXERCISE ANALONAL ANALONALONALONALONALONAL ANALONAL ANALONALONALONALONALONAL ANALONALONALONALONALONALONALONALONAL ANALONAL ANALONALONALONA
Justification	The TIMP helps to reduce over-dependence of maize flour. Maize
	production has been negatively affected by climate change – e.g.
	Maize Lethal Necrosis Disease (MLND) and Fall Army Worm
	(FAW). Hence the need to diversify flour sources. Use of green
	T · · · · · · · · · · · · · · · · · · ·
---------------------------------------	---------------------------------------------------------------------------------
	gram flour is one such example. Diversification of green gram food
	products will enhance consumption of green grams, and demand
	thus spur increased production. Green grams can be processed to
	make flour, which can either be fortified or used to make nutritious
	porridge, or mixed with wheat flour (ration of 1:1) to make various
	bakery products (chapati, mandazi, bread and cakes).
<b>B:</b> Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Farmers, traders, small-scale processors / enterprenuers, industrial
	and commercial processors
Approaches to be used in	On-farm demonstration, field days, agricultural shows and
dissemination	exhibitions, promotional materials (posters/brochures/leaflets),
	exposure tours to processing groups
Critical/essential factors for	Participatory implementation, stakeholder capacity building and
successful promotion	networks, promotions involving Public Private Partnerships (PPP);
I	increased production of high-quality green grams, availability of
	quality standards
Partners/stakeholders for	• Farmer groups – provide land for establishment of small-scale
scaling up and their roles	green gram processing facility
	<ul> <li>Extension service providers to help in the dissemination</li> </ul>
	• KALRO will train trainers and provide technical
	backstopping on dissemination of green gram flour production
	technology
	• KEPS Standards formulation for groon grow flour
	• REBS – Standards formulation for green grain flour,
	Private asstant grant and associated and a processors
	• Private sector processors
	• Supermarkets and institutions (e.g. schools and hospitals) will
	provide markets for the green gram flour
	National and County governments
	• Financial institutions to provide funds for processors
C: Current situation and futu	re scaling up
Counties where already	Baringo, Isiolo
promoted, if any	
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
be upscaled	Baringo, Tana River
Challenges in dissemination	• Limited awareness of the technology by farmers
	• Majority of the Kenyan population only recognizing maize as
	the staple food
	• Difficulty in acquiring certificates from regulatory authorities,
	lack of standards for the product, lack of credit facilities
Suggestions for addressing	• Awareness creation about the product to the government
the challenges	agencies, farmers, and traders
C C	• Capacity building of farmers on how to make and use the
	products
	<ul> <li>Involvement of regulatory agencies and policy makers in up-</li> </ul>
	scaling process linkage to credit facility providers to promote
	commercialization advocacy for its widespread use
	• Nutrition education to Kenvan consumers on the need to
	diversify their food base and include other crops like green

	grams, focusing on the nutritional quality of green grams (rich
	in minerals).
	• Working with KEBS to develop standards for green gram flour
Lessons learned in up scaling,	• It would be good for farmer tours to processing groups to
if any	expose farmers to green gram flour production technology
	• Adequate capacity building is essential for technology adoption
	• Target women and youth as entrepreneurs in society who are
	the major adopters (manufacturers) and consumers,
	respectively.
Social, environmental, policy	• Regulatory bodies e.g. KEBS ensure processors are certified;
and market conditions	and develop standards for green gram flour
necessary for development	• Changing consumer behaviour to incorporate green gram flour
and up scaling	• Existing and new markets are developed and maintained
	• Policies on composite flours are developed and / or
	implemented
D: Economic, gender, vulnera	ble and marginalized groups (VMGs) considerations
Basic costs	Not yet determined
Estimated returns	Not yet determined
Gender issues and concerns in	• Women had limited markets to sell green gram
development, dissemination	products due to limited mobility and exposure
adoption and scaling up	• Processing is mainly done by women, who have limited
	access and control of resources such as finances to purchase
	products for blending
	• Women, men and the youth should participate in
	technology demonstrations
	• Processing is mainly done by women and it is involving the youth and men will reduce drudgery for women.
	• Women were not aware that <i>mandazi</i> and <i>chapatti</i> could be processed using gran grams
	• Target women and youth agro-processors / entrepreneurs; start
	by targeting informal roadside sellers of <i>mandazi</i> and <i>chapatti</i>
	in the study areas, who may find it easy to incorporate green
	gram flour into their product portfolios.
	• Some gender, e.g. men in certain communities, avoid eating
	green grams, but may be in a position to eat diversified green
	gram products prepared from green gram flour
Gender related opportunities	Women and youth stand to benefit in production, use and sale of
	green gram flour.
	There will be job creation for youth and women in selling
	mandazi and chapatti in the study areas
	There will be improvement in food security and nutrition for
	women and youth
VMG issues and concerns in	• VMGs lacks access to information on now toobhologies and
development dissemination	information
adoption and scaling up	<ul> <li>VMGs have limited access to productive resources such as land</li> </ul>
	credit facilities and equipment
L	treat mentiles and equipment

	<ul> <li>VMGs have limited access to agricultural information and extension</li> <li>VMGs have no finances to purchase equipment for value addition of green grams due to limited access to credit facilities</li> </ul>
VMG related opportunities	<ul> <li>There is employment for VMGs in processing and selling of the diversified products</li> <li>The micro-nutrients in green gram flour are particularly healthy for persons with HIV/AIDS</li> <li>Nutritious products can be made from green gram flour contributing to the nutrition of VMGs.</li> <li>Women can diversify family diet and generate income at village level by making the products for sale</li> </ul>
E: Case studies/profiles of success stories	
Success stories	Youth groups processing green gram flour in green gram growing areas
Application guidelines for users	Wayua, F., Wasike, V. and Wasilwa, L. (2020). Green gram flour. KALRO/KCSAP Programme Factsheet No. #, July 2020
<b>F: Status of TIMP readiness</b> (1-Ready for upscaling, 2- requires validation, 3-requires further research)	Requires validation
G: Contacts	
Contacts	Centre Director, KALRO Kakamega P.O. Box 169-50100, Kakamega Email: <u>Francis.Obuoro@kalro.org</u> Tel. 05620-30031/30039
Lead organization and scientists	KALRO: Francis Wayua., Victor Wasike, Francis Wayua
Partner organizations	Traders and processors / enterprenuers, extension service providers, KEBS, financial institutions

- 1. Optimizing blending *ratio* and processing *procedures* for green gram flour.
- 2. Characterising the various green gram varieties for their green gram flour yield production potential
- 3. Providing data on gross margins for green gram flour production

2.10.2 TIMP name	Green gram balls	
Category (i.e. technology,	Innovation	
innovation or management		
practice)		
A: Description of the technology, innovation or management practice		
Problem addressed	Limited green gram utilisation products	
What is it? (TIMP	A food product prepared from deep frying green grams which have	
description)	been boiled, mashed, mixed with wheat flour, and kneaded into balls	

Justification	Diversification of green gram food products will enhance consumption of green grams, enhance demand and thus spur increased production.
<b>B:</b> Assessment of dissemina	ation and scaling up/out approaches
Users of TIMP	Farmers, microenterprise processors, traders, industrial and
	commercial processors
Approaches to be used in	On-farm demonstration, field days, agricultural shows and
dissemination	exhibitions, exposure tours to processing facilities, promotional
	materials (posters/brochures/leaflets)
Critical/essential factors	Participatory implementation, stakeholder capacity building and
for successful promotion	networks, promotions involving Public Private Partnerships (PPP);
-	increased production of high-quality green grams, availability of
	quality standards
Partners/stakeholders for	• Farmer groups – provide land for establishment of small-scale
scaling up and their roles	green gram processing facility
	• Extension service providers to help in the dissemination
	• KALRO – will train trainers and provide technical backstopping
	on dissemination of green gram balls production technology
	• KEBS – Standards formulation for green gram balls, certification
	of private processors
	Private sector processors / enterprenuers
	• Supermarkets and institutions (e.g. schools and hospitals) will
	provide markets for the green gram flour
	National and County governments
	Financial institutions to provide funds for processors
C: Current situation and f	uture scaling up
Counties where already	Baringo, Isiolo
promoted, if any	
Counties where TIMPs	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot, Baringo,
will be upscaled	Tana River
Challenges in	• Limited awareness of the technology by farmers
dissemination	

	<ul> <li>Majority of the Kenyan population only recognizing maize as the staple food</li> </ul>	
	• Difficulty in acquiring certificates from regulatory authorities, lack of standards for the product, lack of credit facilities	
Suggestions for addressing the challenges	<ul> <li>Awareness creation about the product to the government agencies, farmers, and traders</li> <li>Capacity building of farmers on how to make and use the products</li> </ul>	
	• Involvement of regulatory agencies and policy makers in up- scaling process, linkage to credit facility providers to promote commercialization, advocacy for its widespread use	
	<ul> <li>Nutrition education to Kenyan consumers on the need to diversify their food base and include other crops like green grams, focusing on the nutritional quality of green grams (rich in minerals).</li> <li>Working with KEBS to develop standards for green gram balls</li> </ul>	
Lessons learned in up	<ul> <li>It would be good for farmer tours to processing groups to expose farmers to green gram hall production technology.</li> </ul>	
	<ul> <li>Adequate capacity building is essential for technology adoption</li> <li>Target women and youth as entrepreneurs in society who are the major adopters (manufacturers) and consumers, respectively.</li> </ul>	
Social, environmental,	Regulatory bodies e.g. KEBS ensure processors are certified; and	
conditions necessary for	<ul> <li>Changing consumer behaviour to incorporate green gram products</li> </ul>	
development and up scaling	• Existing and new markets are developed and maintained	
D: Economic, gender, vulnerable and marginalized groups (VMGs) considerations

- Providing data on gross margins for green gram balls production

2.103.TIMP name	Green gram crackies
Category (i.e. technology,	Innovation
innovation or management	
practice)	
A: Description of the technolo	gy, innovation or management practice
Problem addressed	Limited green gram utilisation products
What is it? (TIMP	A food product prepared from deep frying green grams which have
description)	been boiled, mashed, mixed with wheat flour, and extruded using a
	noodle machine.

Justification	Diversification of green gram food products will enhance
	consumption of green grams, enhance demand and thus spur
B: Assessment of dissemination	on and scaling up/out approaches
Users of TIMP	Farmers, traders, extension agents, restaurants, small-scale
	processors, industrial and commercial processors
Approaches to be used in	On-farm demonstration, field days, agricultural shows and
dissemination	exhibitions, exposure tours to processing facilities, promotional
	materials (posters/brochures/leaflets)
Critical/essential factors for	Participatory implementation, stakeholder capacity building and
successful promotion	networks, promotions involving Public Private Partnerships (PPP);
	quality standards
Partners/stakeholders for	<ul> <li>Farmer groups – provide land for establishment of small-scale</li> </ul>
scaling up and their roles	green gram processing facility
5 I	<ul> <li>Extension service providers to help in the dissemination</li> </ul>
	• KALRO – will train trainers and provide technical
	backstopping on dissemination of green gram balls production technology
	• KEBS – Standards formulation for green gram balls.
	certification of private processors
	Private sector processors / entrepreneurs
	• Supermarkets and institutions (e.g. schools and hospitals) will
	provide markets for the green gram flour
	National and County governments
	Financial institutions to provide funds for processors
C: Current situation and futu	ire scaling up
Counties where already promoted, if any	Baringo, Isiolo
Counties where TIMPs will	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot.
be upscaled	Baringo, Tana River
Challenges in dissemination	Limited awareness of the technology by farmers
	• Majority of the Kenyan population only recognizing maize as the staple food
	• Difficulty in acquiring certificates from regulatory authorities, lack of standards for the product, lack of credit facilities
Suggestions for addressing	• Awareness creation about the product to the government
the challenges	agencies, farmers, and traders
	• Capacity building of farmers on how to make and use the
	products

Lessons learned in up scaling, if any	<ul> <li>Involvement of regulatory agencies and policy makers in upscaling process, linkage to credit facility providers to promote commercialization, advocacy for its widespread use</li> <li>Nutrition education to Kenyan consumers on the need to diversify their food base and include other crops like green grams, focusing on the nutritional quality of green grams (rich in minerals).</li> <li>Working with KEBS to develop standards for green gram crackies</li> <li>It would be good for farmer tours to processing groups expose farmers to green gram crackies production technology</li> <li>Adequate capacity building is essential for technology adoption</li> </ul>
Social, environmental, policy and market conditions necessary for development and up scaling	Target women and youth as entrepreneurs in society who are the major adopters (manufacturers) and consumers, respectively.
<b>D: Economic. gender. vulner</b> a	ble and marginalized groups (VMGs) considerations
Basic costs	Not yet determined
Estimated returns	Not yet determined
Gender issues and concerns in development, dissemination adoption and scaling up	<ul> <li>Women also had limited skills relating to making green gram crackies <ul> <li>Women have limited processing skills due to limited mobility and exposure due to their busy schedule and domestic roles</li> <li>Processing is mainly done by women, who have limited access and control of resources such as finances to purchase products for blending</li> <li>Women, men and the youth should participate in technology demonstrations</li> <li>Processing is mainly done by women and it is involving adding more work burden to women</li> <li>Women were not aware of some products such as green grams</li> <li>Some gender, e.g. men in certain communities, avoid eating green grams, but may be in a position to eat diversified green gram products</li> </ul> </li> </ul>
Gender related opportunities	Improves marketability of green grams due to diversified products There is increased food security and nutrition
VMG issues and concerns in development, dissemination adoption and scaling up	<ul> <li>VMGs lacks access to information on new technologies and information</li> <li>VMGs also have limited skills relating to making green gram crackies</li> <li>VMGs have limited processing skills due to limited mobility and exposure due to their busy schedule and domestic roles</li> </ul>

	<ul> <li>Processing work is labor intensive for some VMGs especially the abled differently</li> <li>VMGs might not be aware of some products such as green gram crackies that they could be processed using green</li> <li>VMGs have limited knowledge on new technologies and information due to their status in the society</li> </ul>
VMG related opportunities	<ul> <li>VMGs have diversified diet and generate income at village level by making the products for sale</li> <li>Nutritious products can be made from green gram flour contributing to the nutrition of VMGs.</li> <li>There is potential for employment for VMGs</li> </ul>

• Characterizing the various green gram varieties for their cake production potential (for example, which variety produces the best quality cakes?)

# 2.11 Mechanization of Green Gram Production Activities

2.11.1 TIMP Name	Power Tiller
Category (i.e. technology, innovation or	Technology
management practice)	

A: Description of the technology innovation	n ar management practice
Problem to be addressed	• Difficult to prepare a uniform fine tilth seedbed
	manually
	• Slow and tedious processes of seedbed preparation
	in a commercialized Green gram commodity
	• Drudgery leads to low acreage
	• Delayed operation lead to late planting
	High cost of manual Labour
What is it? (TIMP description)	A Power tiller is a low powered two-wheeled agricultural implement also referred to as a walking tractor 8-16hp that can be fitted with implements such as a rotary tiller, disk harrow, mouldboard plough, trailer, chisel or water pump at alternate times for easing farm operations. It can complete one hectare in two hours per operator. This will vary depending on the climatic conditions, soil types, soil moisture content, operator stamina and experience. Fuel consumption is about 15 liters per ha. Though these results may vary with the technical ability or aptitude of the operator.
Justification	It has multiple uses and other advantages. A Power Tiller can be used in seedbed preparation, sowing seed, planting seed, spraying of fertilizer or herbicide and even irrigation. In addition, can also be used for threshing and transporting produce. A power tiller is ideal where the land size is small. Farm sizes less than one hectare may limit maneuverability of conventional tractors and manual Labour is costly to maintain apart from being slow
B: Assessment of dissemination and scaling	g up/out approaches

Users of the TIMP	Green gram farmers and researchers
Approaches used in dissemination	• Farmer field and business Schools(FFBS)
	Agricultural Innovation Platforms (AIP)
	• Field Demonstrations and training,
	• Agricultural shows (ASK) and other exhibitions
Critical/essential factors for successful	• Applied and adaptive Research to test, validate
promotion	and release improved Green gram varieties
	• A platform for interaction of Green gram value
	chain stakeholders
	• Multiple usage, timeliness, efficiency and low cost
Partners/stakeholders for scaling up and	KALRO, Universities (for information)
their roles	Machinery fabricators
	NGO supporting farmers for dissemination
C: Current situation and future scaling	
up	
Counties where the TIMP is already	Meru, Machakos, Embu, Kitui
promoted if any	
Counties where TIMP will be up scaled	Makueni, West Pokot
Challenges in dissemination	• Lack of Green gram innovation platforms to
	facilitate interaction of farmers with relevant
	stakeholders
	• Lack of machines
	• Lack of facilitation to demonstration site
Cuspections for addressing the shallow and	High initial cost for small-scale machines
Suggestions for addressing the challenges	• Establish Green gram innovation platforms
	• Acquisition of the machines
	• Lack of facilitation to demonstration site
	• Build capacity through efficient agricultural production to afford the cost
Lessons learned in up scaling if any	• Chances of successful scaling are higher when
	diverse value chain stakeholders collaborate in an
	innovation platform
	• Partnership is important in technology
	dissemination and adoption and this can be
	facilitated through innovation platforms
	• Mechanization in agriculture increases production
	• Mechanization releases labour to alternative
	requirement areas
	Provides low cost farm operations
Social, environmental, policy and market	• Creation of awareness on mechanization
conditions necessary for development and	importance in agricultural production
up scaling	

	<ul> <li>Include all gender groups in research, and validation.</li> <li>Appropriate policy formulation of agricultural mechanization</li> </ul>
D: Economic, gender, vulnerable and marginalized groups (VMGs) considerations	
Basic costs	KES 280,000
Estimated returns	KES 180,000/ month gross income
Gender issues and concerns in development, dissemination, adoption and scaling up	<ul> <li>Power tiller is not gender friendly especially for women</li> <li>Power tiller would make work easier for women but women will not be able to purchase the equipment due to lack of finances due to limited access to credit facilities</li> <li>Tilling equipments should be designed for easy start and operation by all gender.</li> <li>Up-scaling should target all the gender and it should be affordable to all gender</li> <li>Women have limited access and control of productive resources such as land , information, farm equipment and credits</li> </ul>
Gender related opportunities	<ul> <li>Creates employment especially for youth</li> <li>Reduces drudgery for women farmers as well as men</li> <li>Power tiller increases participation of household</li> </ul>
	women men and youth
VMG issues and concerns in development, dissemination, adoption and scaling up	<ul> <li>Operating Tine hallow is complex for some VMGs especially those who are abled differently</li> <li>VMGs have less access to agricultural information, technology and knowledge so they might have information of the equipment</li> <li>VMGs have limited finances to pay services and to purchase farm equipment due to limited access to credit facilities</li> <li>VMGs need to be equipped with information relating to the TIMP</li> <li>Power tillers need to be designed in such a way which would enable people abled differently to operate it</li> </ul>

	• In addition they need to be affordable and easy to
	maintain by all types of farmers
VMG related opportunities	Creates employment for VMGs
	Reduces drudgery for VMGs
	Increases food production and nutrition for
	VMGs
E: Case studies/profiles of success stories	
Success stories from previous similar	Mechanization has enabled increased production in
projects	other crops such as maize, wheat, Green gram and
	rice
Application guidelines for users	Demonstrations and training
	• User manuals

2.11.2 TIMP Name	4 Wheeled Tractor 50Hp
Category (i.e. technology, innovation or management practice)	<image/>
A: Description of the technology, innovation or management practice	
Problem to be addressed	• Difficult to prepare a uniform fine tilth seedbed
	manually
	• Delayed operation lead to late planting

	• Slow and tedious processes of seedbed preparation,
	in a commercialized Green gram commodity
	High cost of manual labour
What is it? (TIMP description)	A small sized, 4-wheeled tractor is a low powered
	agricultural implement of 40-55hp that can be fitted
	with a rotary tiller, disk harrow, moldboard plough,
	trailer, chisel or water pump at alternate times for
	easing farm operations. It can do 4 hectares per day
	by one operator but can have two operators to run
	another 8 hours of 4 hectares coming to 8ha per day.
	This will vary depending on the climatic conditions,
	soil types, soil moisture content and operator
	experience. Fuel consumption is about 15 liters per ha.
	Though these results may vary with the technical
	ability of the operator.
Justification	It has multiple uses and other advantages. A Power
	Tiller can be used in seedbed preparation sowing
	seed, planting seed, spraying fertilizer, herbicide and
	even irrigation. In addition, can also be used for
	threshing through a power take off device and
	transporting produce. Farm sizes less than one
	hectare may limit maneuverability of conventional
	tractors yet manual Labour is costly and slow.
B: Assessment of dissemination and scaling	yup/out approaches
Users of TIMP	Green gram farmers and researchers
Approaches used in dissemination	• Farmer field and business Schools(FFBS)
	Agricultural Innovation Platforms (AIP)
	• Field Demonstrations and training, Agricultural
	shows (ASK) and other exhibitions
Critical/essential factors for successful	• Applied and adaptive Research to evaluate and
promotion	recommend the tractor for small scale farmers.
	• A platform for interaction of Green gram value
	chain stakeholders
	• Multiple usage, timeliness, efficiency and low cost
Partners/stakeholders for scaling up and	KALRO, Universities (for information)
their roles	Machinery dealers
	NGO supporting farmers for dissemination
C: Current situation and future scaling up	
Counties where already promoted if any	Non
Counties where TIMP will be up scaled	Machakos
Challenges in dissemination	• Lack of Green gram innovation platforms to
	tacilitate interaction of farmers with relevant
	stakeholders

	Lack of tractors
	• Lack of facilitation to demonstration site
	• High initial cost for small-scale machines
Suggestions for addressing the challenges	• Establish a 4-wheeled innovation platform
	• Acquisition of the machines
	• Lack of facilitation to demonstration site
	• Build financial capacity through efficient
	agricultural production to afford the cost
Lessons learned in up scaling if any	• Chances of successful up-scaling are higher when
	diverse value chain stakeholders collaborate in an
	innovation platform
	• Partnership is important in technology
	dissemination and adoption
	• Mechanization in agriculture increases production
	• Mechanization releases labour to alternative
	requirement areas
	Provides low cost farm operations
Social, environmental, policy and market	• Creation of awareness on mechanization
up scaling	Importance in agricultural production
up scaling	• Include all gender groups in research, and validation
	• Appropriate policy formulation of agricultural
	• Appropriate poncy formulation of agricultural
D: Economic, gender, vulnerable and marg	inalized groups (VMGs) considerations
Basic costs	KES 1,780,000,00
Estimated returns	KES 450,000/ month gross income
Gender issues and concerns in development,	• The 4 wheeled tractor 50Hp is gender unfriendly
dissemination, adoption and scaling up	hence it cannot be operated by women
	• Women and youth have limited finances to pay
	services and to purchase farm equipment due to
	limited access to credit facilities such as 4wheeled tractor 50Hp
	<ul> <li>Men dominate most decisions at the household and</li> </ul>
	community levels hence they make decisions
	relating to land preparation for green grams
	<ul> <li>Farming machines should be designed for easy</li> </ul>
	start and operation for all gender
	• Up-scaling should target all the gender
	• The is need to equip women, youth and
	stakeholders with information relating to the
	TIMP
Gender related opportunities	• Creates employment especially for youth

	• Reduces drudgery for women farmers as well as
	men
	• Promotes inclusivity of all genders
VMG issues and concerns in development, dissemination, adoption and scaling up	• Operating wheeled tractor 50Hp is complex for some VMGs especially those who are abled differently
	<ul> <li>VMGs have less access to agricultural information, technology and knowledge hence they might not know where to get such tractors</li> <li>VMGs have limited finances to pay services and to purchase farm equipment due to limited access to credit facilities</li> <li>VMGs need to be equipped with information relating to the TIMP</li> <li>Linking the VMG to financial institutions would enable them to purchase the tractor since it is affordable and easy to maintain machines</li> </ul>
VMG related opportunities	<ul> <li>Creates employment at production, transportation, processing and distribution for VMGs</li> <li>Reduces drudgery for VMG farmers</li> </ul>
E: Case studies/profiles of success stories	
Success stories from previous similar	Mechanization has enabled increased production in
projects	other crops such as maize, wheat, Green gram and rice
Application guidelines for users	Demonstrations and training
	• User manuals
F: Status of TIMP readiness (1-ready for	Ready for up scaling
up scaling;, 2-requires validation; 3-requires	Ready for out scaling
further research)

2.11. 3 TIMP Name	Moldboard Plough
Category (i.e. technology, innovation or management practice)	Technology
A: Description of the technology, innovatio	n or management practice
Problem to be addressed	<ul> <li>Slow and tedious processes of seedbed preparation, in a commercialized Green gram commodity</li> <li>Difficult to prepare a uniform fine tilth seedbed manually</li> <li>Delayed operation lead to late planting</li> <li>High cost of manual Labour</li> </ul>
What is it? (TIMP description)	Moldboard plough is an agricultural implement and is generally considered to be an important tillage implement. Moldboard ploughs are available for power tiller and tractor operation. a moldboard plough does four jobs namely a) cutting the furrow slice, b) lifting the furrow slice. c) inverting the furrow slice and d) pulverizing the furrow slice. Ploughing accounts for more traction energy than any other field operation.
Justification	Has High Efficiency and when well-adjusted, the plough automatically seeks the desired depth. It is Versatile. The various models have different features that enable high efficiency in preparation of the land. Enables weed Control, Pest Control and Improved Soil Health.
<b>B:</b> Assessment of dissemination and scaling	up/out approaches
Users of TIMP	Potato farmers and researchers
Approaches used in dissemination	<ul> <li>Farmer field and business Schools(FFBS)</li> <li>Agricultural Innovation Platforms (AIP)</li> <li>Field Demonstrations and training, Agricultural shows (ASK) and other exhibitions</li> </ul>
Critical/essential factors for successful promotion	<ul> <li>Applied and adaptive Research to test, validate and release improved cabbage varieties</li> <li>A platform for interaction of Green gram value chain stakeholders</li> </ul>

	• Multiple usage, timeliness, efficiency and low cost
Partners/stakeholders for scaling up and	KALRO, Universities (for information)
their roles	Machinery fabricators
	NGO supporting farmers for dissemination

2.11.4 TIMP Name	Disk Harrow
Category (i.e. technology, innovation or management practice)	Technology
A: Description of the technology, innovatio	n or management practice
Problem to be addressed	<ul> <li>Slow and tedious processes of seedbed preparation, in a commercialized Green gram commodity</li> <li>Difficult to break clods manually</li> <li>Delayed operation lead to late planting</li> <li>Low acreage because of lack of manual labour</li> <li>High cost of manual labour</li> </ul>
What is it? (TIMP description)	A harrow, farm implement used to pulverize soil, break up crop residues, uproot weeds and cover seed. It is a farm implement used for surface tillage. It is used after ploughing for breaking up and smoothing out the surface of the soil. The purpose of harrowing is to break up clods and to provide a soil structure, called tilth, that is suitable for planting seeds. Coarser harrowing may also be used to remove weeds and to cover seed after sowing.
Justification	<ul> <li>Creating of a crumbly layer for planting manually is tedious.</li> <li>It is not possible to manually protect the soil surface from rapid drying.</li> <li>Improving both the air and water penetrability into soil can be too expensive if manually undertaken.</li> <li>Manual operation will reduce microbiological processes in the soil</li> </ul>

	• Manual land harrowing Improves nutrient
	availability to plants.
<b>B:</b> Assessment of dissemination and scaling	up/out approaches
Users of TIMP	Green gram farmers and researchers
Approaches used in dissemination	• Farmer field and business Schools(FFBS)
	Agricultural Innovation Platforms (AIP)
	• Field Demonstrations and training, Agricultural
	shows (ASK) and other exhibitions
Critical/essential factors for successful	• Applied and adaptive Research to test, validate
promotion	and release improved cabbage varieties
	• A platform for interaction of Green gram value
	chain stakeholders
	• Multiple usage, timeliness, efficiency and low cost
Partners/stakeholders for scaling up and	KALRO, Universities (for information)
their roles	Machinery fabricators
	NGO supporting farmers for dissemination
C: Current situation and future scaling up	
Counties where already promoted if any	Non
Counties where TIMP will be up scaled	Makueni
Challenges in dissemination	• Lack of Green gram innovation platforms to
	facilitate interaction of farmers with relevant
	stakeholders
	Lack of machines
	• Lack of facilitation to demonstration site
	High initial cost for small-scale machines
Suggestions for addressing the challenges	Establish Green gram innovation platforms
	Acquisition of the machines
	• Lack of facilitation to demonstration site
	• Build capacity through efficient agricultural
	production to afford the cost
Lessons learned in up scaling if any	• Chances of successful scaling are higher when
	diverse value chain stakeholders collaborate in
	an innovation platform
	• Partnership is important in technology
	dissemination and adoption and this can be
	facilitated through innovation platforms
	• Mechanization in agriculture increases production
	• Mechanization releases labour to alternative
	requirement areas
	• Provides low cost farm operations

Social, environmental, policy and market	• Creation of awareness on mechanization
conditions necessary for development and	importance in agricultural production
up scaling	• Include all gender groups in research, and
	validation.
	• Appropriate policy formulation of agricultural
	mechanization
D: Economic, gender, vulnerable and marg	inalized groups (VMGs) considerations
Basic costs	KES 280,000
Estimated returns	KES 180,000/ month gross income
Gender issues and concerns in development,	• Disk Harrow <b>is g</b> ender unfriendly hence it can
dissemination, adoption and scaling up	not be operated by women
	• The machine is expensive for green grams
	stakeholders to purchase especially women
	• Women and youth have limited finances to pay services and to purchase farm equipment due to
	limited access to credit facilities
	• Women and youth have limited access to
	education, training and extension services than men
	• Men dominate most decisions at the household
	and community levels hence determines the type of
	• Disk harrow should be designed for easy start
	and operation
	• Un-scaling should target all the gender
	• The is need to equip women youth and
	stakeholders with information relating to the TIMP
	stakeholders with information relating to the rinvir
Gender related opportunities	Creates employment especially for youth
	Reduces drudgery for women farmers as
	well as men Facilitation to access
	information
VMG issues and concerns in development,	• Operating a disk harrow is complex for some
dissemination, adoption and scaling up	VMGs especially those who are abled differently
	• VMGs have less access to agricultural
	information, technology and knowledge hence
	they might not be aware of the existence of a disk barrow and how it is operated
	VMGs have limited finances to pay services
	and to purchase farm equipment due to limited
	access to credit facilities
	• VMGs need to be equipped with information
	relating to the TIMP
	• Farm machines need to be designed in such
	a way which would enable people able
	differently to operate

	• In addition they need to be affordability and
	easy to maintain machines for all types of
	farmers
VMG related opportunities	Creates employment especially for youth
	Reduces drudgery for VMGs
E: Case studies/profiles of success stories	
Success stories from previous similar	Mechanization has enabled increased production in
projects	other crops such as maize, wheat, Green gram and
	rice

2.11.5 TIMP Name	Tine Harrow
A: Description of the technology, innovatio	n or management practice
Problems to be addressed	• Drudgery
	• Inefficient clod breaking
	• Delayed task accomplishment
What is it? (TIMP description)	It is a harrow with peg shaped teeth of diamond cross
	section to a rectangular frame. It is used to
	• break clod
A REAL PROPERTY AND A REAL	• stir soil
	• uproot weeds
Charles Bass Balling	• level ground
	• break soil
	• cover seeds.
Justification	The cost of labour, inefficiencies breaking clods,
	ability of stirring soil, uprooting weeds, ease of
	leveling ground, breaking soil and covering seeds

Counties where variety was tested and promoted	Non
Counties where the TIMP will be promoted	Machakos
B: Assessment of dissemination and	
scaling up/out approaches	
Users of TIMP	Farmers, extension agencies, seed producers,
	contractors, machine operators.
Approaches used in development and	On-farm experimentation and dissemination, field
dissemination	days, shows, farmer to farmer communication, leaflets,
	larger plot demonstrations.
Most effective approach	On-farm experimentation and larger plot effect
	demonstrations.
Critical/essential factors for successful	Participatory implementation, stakeholder capacity
promotion	building, stakeholder networks and effective extension
	services.
Partners/stakeholders for scaling up and	Public and private Partners (MoALF&I) ICRISAT,
their respective roles.	FIPs (Farmer Input Promotion), , Farmer Groups,
	Service provider agencies e.g. micro-finance agencies,
	banks, agro-vets, processors and manufacturers,
	aggregators e.g. CARD (Community Action for Rural
	[Development)] and others e.g. NGOs, CBOs, and
	LPDO2

C: Current situation and future scaling up Current extent of reach Challenges in development and dissemination Suggestions for addressing the challenges Lessons learned in up scaling, if any Social, environmental, policy and market conditions necessary D: Economic, gender, vulnerable and marginalized groups (VMGs) considerations Basic costs Estimated returns Gender issues and concerns in development,	Nil         • Machine availability         • Land size         • Trained plant operators         • Contracting approach/sharing         • Use of smaller equipment         • Train plant operators         Nil         Gender inclusiveness in crop research and development; Capacity building of stakeholders; understanding the physical and biotic environment in target ecologies; understanding community culture, preferences, and practices         Per acre production cost KES 1,700/=         Not yet tried         • Tine harrow is gender friendly to operate especially for

	• Women and youth have limited finances to pay services
	and to purchase farm equipment due to limited access to
	credit facilities
	• Women and youth have limited access to education,
	training and extension services than men
	• Men dominate most decisions at the household and
	community levels hence determines the type of
	facilities to be used in farms
	• Farming machines should be designed for easy start and operation.
	• Up-scaling should target all the gender
	• There is need to equip women, youth and stakeholders
	with information relating to the TIMP
Gender related opportunities	High productivity
	Creates employment especially for youth
	• Reduces drudgery for women farmers as well as
	men
	• With mechanization men gets attracted to
	planting seeds which was perceived as women
	activity –Increasing equality in gender division of
	labour
VMG issues and concerns in development,	• Operating Tine hallow is complex for some VMGs
dissemination, adoption and scaling up	especially those who are abled differently
	• VMGs have less access to agricultural information,
	technology and knowledge
	• VMGs have limited finances to pay services and to
	purchase farm equipment due to limited access to
	credit facilities
	• VMGs need to be equipped with information
	relating to the TIMP
	• Farm machines need to be designed in such a way
	which would enable people able differently to
	operate
	• In addition they need to be affordable and easy to
	maintain by all types of farmers
VMG related opportunities	Creates employment especially for youth
	Reduces drudgery for VMGs
	• Increases food production and nutrition for VMGs

Partner organizations	Egerton University

2.11.6 TIMP Name	Seed Drill
Category (technology, innovation or management practice)	Technology
A: Description of the technology, innovatio	n or management practice
Problem to be addressed	<ul> <li>Slow and tedious processes of planting, in a commercialized Green gram commodity</li> <li>Difficult to deliver small grains in a row at specified seed rate manually</li> <li>Delayed operation lead to late planting</li> <li>Low acreage because of lack of manual Labour</li> <li>High cost of manual Labour</li> </ul>
What is it? (TIMP description)	It is an implement consisting of a heavy frame set with separated hopper for fertilizer and seed. It is wheel driven to rotate the seed and fertilizer dispenser sprockets. Calibration of seed and fertilizer is done separately by interchanging pairs of gears to match the required gear ratio. It has coulters to open a furrow for delivery of seed and fertilizer while another is cover the planted furrow. The planter is dragged harrowed land to plant.

Justification	<ul> <li>Making rows and planting small seed at a specified rate as it is covered is not possible manually.</li> <li>It is not possible to manually protect the soil surface from rapid drying.</li> <li>It is even more difficult to plant small seed at a predetermine depth uniformly.</li> <li>Manual operation will reduce microbiological</li> </ul>
	<ul> <li>processes in the soil</li> <li>Mechanical Green gram seed planting increases</li> </ul>
B. Assessment of dissemination and scaling	gennination uniformity
Users of TIMP	Green gram farmers and researchers
Approaches used in dissemination	<ul> <li>Farmer field and business Schools(FFBS)</li> <li>Agricultural Innovation Platforms (AIP)</li> <li>Field Demonstrations and training, Agricultural shows (ASK) and other exhibitions</li> </ul>
Critical/essential factors for successful	• Applied and adaptive research to evaluate and
promotion	<ul> <li>recommend</li> <li>A platform for interaction of Green gram value chain stakeholders</li> </ul>
	• Multiple usage, timeliness, efficiency and low cost
Partners/stakeholders for scaling up and	KALRO, Universities (for information)
	NGO supporting farmers for dissemination
C: Current situation and future scaling up	
Counties where already promoted if any	Non
Counties where TIMP will be up scaled	Machakos
Challenges in dissemination	<ul> <li>Lack of Green gram innovation platforms to facilitate interaction of farmers with relevant stakeholders</li> <li>Lack knowledge for appropriate machines</li> <li>High initial cost for small-scale machines</li> </ul>
Suggestions for addressing the challenges	<ul> <li>Establish Green gram innovation platforms</li> <li>Acquisition of the machines</li> <li>Lack of facilitation to demonstration site</li> <li>Build capacity through efficient agricultural production to afford the cost</li> </ul>
Lessons learned in up scaling if any	• Chances of successful scaling are higher when diverse value chain stakeholders collaborate in an innovation platform

	• Partnership is important in technology
	dissemination and adoption and this can be
	facilitated through innovation platforms
	• Mechanization in agriculture increases production
	• Mechanization releases labour to alternative
	requirement areas
	Provides low cost farm operations
Social, environmental, policy and market	• Creation of awareness on mechanization
conditions necessary for development and	importance in agricultural production
up scaling	• Include all gender groups in research, and validation.
	• Appropriate policy formulation of agricultural mechanization
D: Economic, gender, vulnerable and marg	inalized groups (VMGs) considerations
Basic costs	KES 40,000 (power auger digger), KES 80,000
	(Tractor mounted hole digger)
Estimated returns	KES 20,000/ month gross income
Gender issues and concerns in development,	• Seed driller is gender unfriendly so it is not easily
dissemination, adoption and scaling up	operated by women
	• Seed driller is an expensive machines for women to purchase
	• Green gram machines should be designed for easy
	start and operation.
	• Up-scaling should target all the gender
	Affordability to all gender
Gender related opportunities	Creates employment especially for youth
	• Reduces drudgery for women farmers as well as
	men
	• It attract participation of all genders
VMG issues and concerns in development,	• VMGs have limited finances to pay services and to
dissemination, adoption and scaling up	purchase the seed driller since they do not have to
	limited access to credit facilities
	• Operating a seed driller is complex for some
	VMGs especially those who are abled differently
	• VMGs need to be equipped with information
	relating to the TIMP
	• Seed drillers need to be designed in such a way
	which would enable people able differently to
	In addition they need to be affordable and easy to     maintain machines for all types of formers former
	agging and the to limited access to credit facilities
	equipment due to minied access to credit facilities

VMG related opportunities	• Can create employment for VMG at local level
	• It makes work easier for the VMGs
E: Case studies/profiles of success stories	
Success stories from previous similar	Mechanization has enabled increased production in
projects	other crops such as maize, wheat, Green gram and rice
Application guidelines for users	User manuals and leaflets

2.11.7 TIMP Name	Seed planter
Category (i.e. technology, innovation or	Technology
management practice)	
A: Description of the technology, innovatio	n or management practice
Problems to be addressed	• Drudgery
	• Efficient seed and fertilizer placement
	Delayed task accomplishment
What is it? (TIMP description)	It is a seed dispenser on the farm that places seed and
	fertilizer at predetermined quantities. It is commonly
9	used in small grains. It is propelled by a tractor. It is an
	attachment of a tractor of size 45-65hp than can
Act - Martin Contraction	economically tow the implement on a well prepared
	seedbed using a plough, disk harrow and tine harrow
Justification	The cost of labour, inefficiencies in seed placement,
	releases labour for other activities and tremendously
	reduces time taken on a unit area being planted resulting
	into increased productivity.
Counties where variety was tested and	Non
promoted	
Counties where the TIMP will be promoted	Machakos Tharaka Nithi, Kitui, Makueni
<b>B:</b> Assessment of dissemination and scaling	g up/out approaches

Users of TIMP	Farmers, Universities, researchers, extension agencies,
	seed producers, contractors, machine operators.
Approaches used in development and	On-farm experimentation and dissemination, field days,
dissemination	shows, farmer to farmer communication, leaflets, larger
	plot demonstrations.
Most effective approach	On-farm experimentation and larger plot effect
	demonstrations.
Critical/essential factors for successful	Participatory implementation, stakeholder capacity
promotion	building, functioning, stakeholder networks and
	effective extension services.

2.11.10 TIMP Name	Motorized Sprayer						
Category (technology, innovation or	Technology						
management practice)		Herbicides Pre-emerge Post-emerge Systemic Post-emerge Systemic	Nozzle Even Flat Fan Very Good Very Good	Suide for Band an This Even Flat Fan Good Very Good Good	d Directed Spray Holiow Cone Very Good	Full Cone	Disc and Care Core
		Fungicides Contact Systemic Insecticides Contact	Good Very Good	Very Good	Good Very Good		Very Good Good Very Good
		Systemic Growth Regulators	Very Good Good	,	,	Very Good	Good
A: Description of the technology, innovation or management practice							

Problem to be addressed	It is a slow and tedious processes of manual spraying		
	Green gram; Green gram has a high number of pests		
	that invade leaf, stem tuber,		
What is it? (TIMP description)	A motorized <b>sprayer</b> is a device used to spray a liquid,		
	where sprayers are commonly used for projection of the		
	chemical, weed killers, crop performance materials,		
	pest maintenance chemicals, as well as manufacturing		
	and production line ingredients. In agriculture, a		
	sprayer is a piece of equipment that is used to		
	apply herbicides, pesticides and fertilizers on		
	agricultural crops. Sprayers are man-portable units		
	typically backpacks with spray guns. They are used to		
	control; weeds that can harbour insects by use of		
	herbicides, insect pests that can cause diseases by the		
	use of insecticides as well as pesticides. Control of		
	micronutrients on the plants		
Justification	Past reduce yields up to 98% and are a major menace in		
Justification	agricultural production Before Green gram forms a		
	canopy, broad leafed weeds compete with Green gram		
	seedling for nutrients and light greatly reducing their		
	vield. Manual spravers are labour intensive while		
	spraving labour is too expensive. It has lower pressure		
	reducing its efficiency hence a motorized knapsack		
	comes in handy.		
	A modern motorized knapsack power that pumps four		
	times faster and covers a wide area in a short time than		
	the manual sprayer		
	With the motorized sprayer, farmers can spray up to 2ha		
	of land in one day as compared to the manual one which		
	covers only one in a day.		
<b>B:</b> Assessment of dissemination and scaling	gup/out approaches		
	Green gram Farmers and agribusiness entrepreneurs		
Approaches used in dissemination	• Farmer field and business Schools(FFBS)		
	Agricultural Innovation Platforms (AIP)

2.11.11 TIMP Name	Seed drill planter	
Category (i.e. technology, innovation or	Technology	
management practice)		
A: Description of the technology, innovation or management practice		

12.2.11 TIMP Name	Combine Harvester
Category (i.e. technology, innovation or	Technology
management practice)	

A: Description of the technology, innovation or management practice			
Problems to be addressed	Drudgery		
	• Efficiencies in grain detachment,		
	winnowing, fuel, throughput and output.		
	• Delayed task accomplishment		
What is it? (TIMP description)	<ul> <li>A combine harvester, is a versatile machine designed to efficiently harvest a variety of grain crops. The name derives from its combining three separate harvesting operations—reaping, threshing, and winnowing—into a single process.</li> <li>The major components of the machine include threshing, separation and cleaning units.</li> <li>After being beaten, the grains fall through a concave grid into the cleaning unit which consists of blower set to a speed that only blows out chaff and grain is collected on a receptor</li> </ul>		
Institution	The cost of labour inefficiencies in grain detachment		
Justification	winnowing fuel throughput and output makes it		
	necessary for increased productivity		
Counties where Combine Harvester was	Meru Machakos Embu Kitui		
tested and promoted			
Counties where the TIMP will be promoted	Bomet, Kericho and West Pokot		
<b>B:</b> Assessment of dissemination and scaling	gup/out approaches		
Users of TIMP	Farmers, extension agencies, seed producers,		
	contractors, machine operators.		
Approaches used in development and	On-farm experimentation and dissemination, field		
dissemination	days, shows, farmer to farmer communication, leaflets,		
	larger plot demonstrations.		
Most effective approach	On-farm experimentation and larger plot effect		
	demonstrations.		
Critical/essential factors for successful	Participatory implementation, stakeholder capacity		
promotion	building, functioning, stakeholder networks and		
	effective extension services.		
Partners/stakeholders for scaling up and	Public and private Partners (MoALF&I) ICRISAT,		
their respective roles.	FIPs (Farmer Input Promotion), , Farmer Groups,		
	Service provider agencies e.g. micro-finance agencies,		
	banks, agro-vets, processors and manufacturers,		
	aggregators e.g. CARD (Community Action for Rural		
	Development)] and others e.g. NGOs, CBOs, and		
	FBOs		
C: Current situation and future scaling up			

Current extent of reach	Nil
Challenges in development and	Protective clothing
dissemination	Machine availability
	• Trained machine operators
Suggestions for addressing the challenges	Contracting approach/sharing
	• Train on machine operation
Lessons learned in up scaling, if any	• Size, Portability, discharge height
Social, environmental, policy and market	Gender inclusiveness in Machine research and
conditions necessary	development; Capacity building of stakeholders;
	understanding community culture, preferences, and
	practices
D: Economic, gender, vulnerable and marg	inalized groups (VMGs) considerations
Basic costs	Per acre production cost KES 2,500/=
Estimated returns	Not yet tried
Gender issues and concerns in development	• Combine harvester is complicated for women to
and dissemination	operate
	• Combine harvester is also expensive for women to
	attord
	• women and youth have limited finances to pay services
	credit facilities
	• Women have limited access to education, training and
	extension services than men relating to farm
	mechanization
	• Men dominate most decisions at the household and
	facilities to be used in farms
	<ul> <li>Combine harvesters should be designed for easy start</li> </ul>
	and operation.
	• Up-scaling should target all the gender and they should
	be affordable to all gender
Gender related opportunities	• Reduced labour intensity in threshing
	• High productivity is increased food security and
	nutrition
	• Creates employment especially for youth
	• Reduces drudgery for women farmers as well as
	men
VMG issues and concerns in development,	• VMGs have limited finances to pay services and to
dissemination, adoption and scaling up	purchase farm equipment due to limited access to
	credit facilities
	• Operating a combine harvester is complicated for
	some VMGs especially those who are abled
	differently to operate

	<ul> <li>VMGs need to be equipped with information relating to the TIMP</li> <li>Linking the VMG to financial institutions would enable them to buy since it is affordable and easy to maintain machines</li> <li>Farm machines need to be designed in such a way which would enable people able differently to operate</li> </ul>
	• In addition they need to be affordable
VMG related opportunities	Reduced labour intensity in threshing for VMGs
	High productivity is increased food security and nutrition
	Creates employment especially for VMGs
	Reduces drudgery for VMGs

# 2.12 Green Gram Farming Business and Marketing Practices

2.12.1 TIMP name	Transformative Model of production of green grams
Category (i.e. technology, innovation	Management practice
or management practice)	
A: Description of the technology, inn	novation or management practice
Problem addressed	Low green gram productivity due to farmers' limited
	transformation from subsistence-oriented production to
	commercial-oriented production. Farmers remain at low
	productivity if there is lack of efforts to shift to the commercial level
What is it? (TIMP description) Justification	The transformative model builds resiliency of farmers of green gram to focus on market orientation. The transformation model aims at a shift from subsistence to semi-commercial to fully commercial. At the subsistence level, farmers use traditional inputs and the outputs consumed at home. At the semi-commercial level, farmers use both traditional and improved inputs while the output is consumed at home and some get into the markets. At fully commercial, inputs are accessed from the markets and outputs solely for the markets. Transformative model ensures increase in productivity due to the
	surplus demand. Without transformation of green gram production,
	the crop will remain subsistence and commercialization will not be
D. Aggaggegant of diagoningtion and	attainable, leading to the decline in production and income.
B: Assessment of dissemination and scaling up/out approaches	
Users of TIMP	• Small scale farmers
	Small-scale processors
	Green gram exporters
	Food processors
	Local traders

	• Consumers
	• Input markets due to demand in improved markets
Approaches to be used in	• ToT
dissemination	• Field days
	Exhibitions
	Agricultural shows
	Mobile phone text initiative
	• Farmer to farmer
	Mass media
	• Trainings
	Promotional materials (posters/brochures/leaflets)
Critical/essential factors for	<ul> <li>Availability of high yielding seeds</li> </ul>
successful promotion	• Availability of markets
	• Acceptability of green gram in the framing systems
	• Transformative ability of farmers
	Favourable policy for trade in green gram
and their roles	• MoALFI: Mobilize, train and exhibit the products
and then roles	• NGOS / CBOS: -Mobilize, train and exhibit the
	Cooperatives: Perister and train youth/woman groups
	• Cooperatives. Register and train youth/women groups
	KEBS: certification
	• Processors: To process high quality green gram
	products
	• Supermarkets to accept and stock product for sale
	Consumers: Acceptability
	• Marketers: Moving green gram products from
	processors to consumers
C: Current situation and future scal	ing up
Counties where already promoted, if	Machakos, Kitui, Makueni, Tharaka-Nithi
any	
Counties where TIMP will be	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot,
Challenges in dissemination	• Awaranass: Limited awaranass of the aconomic
Chancinges in dissemination	• Awareness. Limited awareness of the economic potential by farmers and consumers
	• Stakeholder linkages: Stakeholders for enhancing
	transformation
	• High intensity of green gram management; both in the
	field and post-harvest
Suggestions for addressing the	• Awareness creation about the potential of green gram
challenges	production to farmers, consumers and other value chain
	actors
	• Information dissemination – postharvest handling,
	value addition, and nutritional attributes of the product
	• Scaling up participation of end-user in technology
	activities
	Promote green gram production all year round

Lessons learned in upscaling, if any	• Resistance of farmers in growing green gram
	• Subsistence levels of green gram production
	• Variability in green gram demand
	• Fluctuations in prices
Social, environmental, policy and	• Farmers' perceptions
market conditions necessary ) for	• Increase in drought frequency
development and upscaling	• Supportive policy in place
	• Organized markets
D: Economic, gender, vulnerable and	l marginalized groups (VMGs) considerations
Basic costs	Total variable costs per acre per season Kshs 19,710
Estimated returns	Returns after deductions of the total variable costs per acre per
	season Kshs 12,790
Gender issues and concerns in	• Women's lives: Improved welfare of women through
development, dissemination and	increased income
related opportunities	• Employment opportunities: Increased employment opportunities for women in marketing green gram products
	<ul> <li>Roles in development and dissemination: Increasing acceptance, perceptions, capacity and reducing negative attitude</li> </ul>
	• Impact assessment: Impact assessment from a gender perspective
	• Capacity of rural women: Build capacity of rural women to identify and articulate their information and services provided by government institutions
	• Self-confidence and empowering: Enhancing self- confidence and empowering them to engage with external agencies
VMG issues and concerns in development, dissemination and	• VMGs' lives: Improved welfare of VMGs through identification of strengths,
opportunities	• Workloads: Lessening the VMGs' work loads
	<ul> <li>Employment opportunities: Increased employment opportunities for VMGs'</li> </ul>
	• VMGs' authority: Enhancing green gram processing
	<ul> <li>Greater access to technologies: Enhancing accessibility to the technology by VMGs</li> </ul>
	• Roles in development and dissemination: Increasing acceptance, perceptions, capacity and reducing negative attitude
	• Impact assessment: Impact assessment from a VMG perspective

	• Extension message: Extension message must be made more relevant to their needs relevant to the growing of green gram
	• Capacity of rural VMGs: Build capacity to VMGs on identifying and articulating their information and services provided by government institutions
	• Self-confidence and empowering: Enhancing self- confidence and empowering them to engage with external agencies

2.12.2 TIMP name	Building a Business Plan for Green gram production
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology	, innovation or management practice
Problem addressed	Low green gram productivity due to unplanned and traditional
	production, leading to lack of production targets, losses and market failure
What is it? (TIMP description)	A green gram business plan serves as an internal management and
	organizing tool, used to communicate outside the business, or both. The
	document contains the elements of marketing strategy, marketing costs,
	income streams and financial requirements
Justification	With a business plan in hand, green gram farmers and rural entrepreneurs
	will be able to take that first step toward the creation of a successful and

	sustainable business. The plan enables farmers to control costs, develop
	marketing strategies and build plans for the production to meet market
	demand
<b>B:</b> Assessment of dissemination	and scaling up/out approaches
Users of TIMP	• Small scale farmers
	Small-scale processors
	Food processors
	Local grain traders

2.12.3 TIMP name	Contracted green gram production model
Category (i.e. technology,	Requires validation
innovation or management	
practice)	
A: Description of the technology	y, innovation or management practice
Problem addressed	Low productivity due to market failure in green gram production, leading to low income and poor quality
What is it? (TIMP description)	Contract farming involves investment by the private companies, extending lines of credit to producers in the form of farming inputs and technical assistance. Under contract farming terms, contractors commit themselves to buy the entire product at an agreed price. On the other hand, producers avail desired produce for sale.
Justification	Without contract farming smallholder farmers realize low prices for their produce. Contract farming is a contractual arrangement between producers and buyers of a farm product. The contract can either be oral or written, and will specify one or more conditions of production and marketing of an agricultural product. In essence, contract farming commits the farmer to produce a certain commodity at a certain time for an agreed price and, in return, the contractor undertakes to buy the commodity, and may provide agricultural extension and other services to producers in order to satisfy production requirements in terms of quality and quantity. The benefits of contract farming to farmers are market access, increased Incomes, reduction in the risk of price fluctuations, credit and financial intermediation, timely provision of inputs, monitoring and labour incentives, reduction of production risk, introduction of higher-value crops, improved collective bargaining, household spill-over benefits and improved access to extension. A written contract farming is recommended.
B: Assessment of dissemination and scaling up/out approaches	
Users of TIMP	Small scale farmers
	• Contractors
Approaches to be used in	• ToT
dissemination	• Field days

## Gaps for further research

- Performance of contracted farming in terms of productivity, sales and profit 1
- Equity distribution
   Improvement in skill and information delivery

2.12.4 TIMP name	Collective marketing
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology	ology, innovation or management practice
Problem addressed	Low productivity leading to low production due to small-scale
	production and marketing of green gram products. Also market inaccessibility due to individual farmer marketing leading to low market power
What is it? (TIMP	Collective marketing is marketing as a group where farmers establish an entity
description)	to create market links. It involves formation of a group of farmers with an
	objective of reducing market inaccessibility. Collective marketing is carried
	through Producer Organizations' (POs) is an institutional vehicle for
	promoting agricultural production by helping farmers solve common
	problems in relation to production inputs, credit, technical knowledge
	and marketing of the produce
Justification	Due to small-scale farming of green gram, marketing as a group would enable
	farmers to gain from economies of scale. The advantages of collective
	marketing are bigger volumes, uniform quality, reliable sellers, reliable buyers,
	continuous supply, higher price and organization. The smallholder farmers of
	green gram do marketing individually. Due to that, there is lack of
	economic scale and the prices offered are low. The formation of producer
	organizations assists small-scale farmers in aggregating the green gram
	produce to form a large scale and gain bargaining power for higher

## Further research

- Profitable opportunities Performance of marketing as a group

2.12.5 TIMP Name	Profitability analysis
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology, innovation or management practice	

Problem addressed	Low green gram productivity due to low farmers' income. The problem of failure of profitability analysis is common among the smallholder farmers. Lack of profitability analysis by farmers in green gram production, leads to
	lack of comparison of costs and returns and therefore poor performance of the agro-enterprise.
What is it? (TIMP description)	Profitability analysis involves recording of costs and returns and therefore
	determination of profit which indicates the performance of the Green gram
	agro-enterprise
Justification	Profitability analysis reviews the management success and sustainability of the
	Green gram business. It indicates areas of adjustment
<b>B:</b> Assessment of disseminatio	n and scaling up/out approaches
Users of TIMP	Farmers, Extension, NGOs, Researchers.
Approaches to be used in	• Trainings
dissemination	• Factsheets
	• Manuals
	• Farmer field and business Schools(FFBS)
	Agricultural Innovation Platforms (AIP)
Critical/essential factors for	Record keeping of costs and returns
successful promotion	• Ability of farmers to keep records
	• Applied and adaptive Research to test, validate and release improved
	Green gram varieties
	• A platform for interaction in Green gram value chain stakeholders
Partners/stakeholders for	• Farmers – record keeping

2.12.6 TIMP Name	Market research for Green gram farmers
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology, i	nnovation or management practice
Problem addressed	Low green gram productivity due to lack of market information. Failure
	of the smallholder farmers in gathering information on markets, leads to
	knowledge asymmetries among the smallholder farmers. Also this leads
	to poor connectivity of smallholders to distance markets.
What is it? (TIMP description)	Market research gathers information on the product buyers, demand, type
	required, minimum volume purchased, collective marketing volume,
	quality, packaging requirements, frequency of delivery, purchase price,
	means of payment and willing to buy from local farmers
Justification	Without market research the smallholder farmers will continue being
	market disintegrated, leading to low market participation.
B: Assessment of dissemination and scaling up/out approaches	
Users of TIMP	• Farmers
	• Traders

	Processors
Approaches to be used in	• Trainings
dissemination	• Factsheets
	• Manuals
	• Farmer field and business Schools(FFBS)

2.12.7. TIMP Name	Marketing Innovation model	
Category (i.e. technology,	Management practice	
innovation or management		
practice)		
A: Description of the technology, i	nnovation or management practice	
Problem addressed	Farmers' failure to apply entrepreneurship while marketing green gram,	
	leading to low prices	
What is it? (TIMP description)	Marketing innovation encompasses entrepreneurship where farmers	
	undertake technology modification, finance and business acumen in an	
	effort to transform innovations into economic goods and ultimately	
	profit.	
Justification	Marketing innovation involves product diversification. Diversification	
	develops various marketing channels Failure to apply innovation in	
	marketing of green gram, the market outlook will be narrow	
B: Assessment of dissemination and scaling up/out approaches

2.12.8 . TIMP Name	Internet/mobile marketing
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the technology, i	nnovation or management practice
Problem addressed	Limited use of technologies among the smallholder farmers while linking
	to markets, leading to poor market access and constraints in marketing
	channels, skills and market information
What is it? (TIMP description)	Internet/mobile marketing refers to the online marketplace that
	provides buyers and sellers with an avenue to meet and exchange
	goods and services These can include a variety of online platforms,
	tools, and content delivery systems
Justification	Internet/mobile marketing is increasingly becoming mandatory for
	businesses of all types. This high adaptability of internet marketing is an
	important benefit that businesses can take advantage of to provide their
	consumers with the best shopping experience. Consumers use a variety
	of online methods for finding, researching, and eventually making
	purchasing decisions. Internet marketing reduces costs.
B: Assessment of dissemination and scaling up/out approaches	
Users of TIMP	• Farmers
	• Traders
	• Processors
Approaches to be used in	• Trainings
dissemination	• Factsheets
	Manuals

## Gaps for further research

- Levels of digital skills by farmers
- Performance of the internet marketing in terms of productivity, sales and profitability

## 2.13 Agricultural Policy Options

2.13.1TIMP Name	National Agricultural policy strategy framework
Category (i.e. technology,	Management practice
innovation or management	
practice)	
A: Description of the techr	nology, innovation or management practice
Problem addressed	Low green gram productivity due to lack of centralizing the smallholder farmers'
	agency and voices in terms of access to inputs and outputs markets. The
	instruments and the rules to achieve the policy productivity objectives are
	inappropriate for the smallholder farmers but instead favour the large scale
	farmers in Kenya.
What is it? (TIMP	The National Agricultural policy strategy framework provides instruments and
description)	rules for the Counties to develop agriculture in terms of productivity objectives
	which can assist the smallholder farmers of green gram.
Justification	Without the National Agricultural policy strategy framework, agriculture will
	remain not integrated with the National development objectives. There will be
	lack of instruments and the rules to achieve agricultural productivity objectives.
<b>B:</b> Assessment of dissemination	ation and scaling up/out approaches
Users of TIMP	• Farmers
	Policy makers
	• Traders
	Processing industries
	• Extension
	• NGOs
	Research institutions

Approaches to be used in	• Meetings
dissemination	• Radio
	• Television
	• Social media (WhatsApp, Facebook, twitter)
	• Internet
	• Farmers' groups
	• Farmer field and business Schools(FFBS)
	Agricultural Innovation Platforms (AIP)
Critical/essential factors	Availability of stakeholders
for successful promotion	• Availability of specific Green gram-based policies
-	• Applied and adaptive Research to test, validate and release improved Green
	gram varieties
	• A platform for interaction in Green gram value chain stakeholders
Partners/stakeholders for	• Farmers – Demanding Green gram policies to support production and
scaling up and their roles	marketing
	• County extension staff - Sensitization of farmers
	NGOs – Sensitization of farmers
	• Private sector (local traders and exporters) – Demanding Green gram policies
	to support production and marketing
	• Research institutions – Sensitization of stakeholders
	• Policy makers – Assist in policy making
C: Current situation and f	uture scaling up
Counties where already	Kitui
promoted if any	
Counties where TIMPs	Isiolo, Machakos, Taita Taveta, Tharaka Nithi, West Pokot, Baringo, Tana
will be up scaled	River
Challenges in development	• Value Chain: Green gram yields remain low and total domestic production is
and	unable to satisfy demand by manufacturers leading to growing imports of raw
dissemination	materials.
	• Aggregation: Aggregation models including cooperatives—suffered after the
	downturn in Green gram production, wherein many farmers abandoned Green
	gram production. These weak organizations provide few services to farmers
	while providing limited bargaining power.
	• Financial Incentives: The government provides only limited support to Green
	gram producers through subsidized seed, irrigation infrastructure, and
	research. Meanwhile the bulk of financial incentives, including tax breaks,
	exemption from import duties, and subsidized electricity, target apparel
	manufacturers downstream in the value chain, primarily those in Export
	Processing Zones (EPZs). Some private companies are investing backward in their supply choins to increase former production by entering purchase
	contracts financing access to inputs and importing their own hybrid sod
	However, none of these efforts are explicitly tied to environmental or CSA
	standards
Suggestions for addressing	Value Chain: Enhance productivity and total production through better seeds
the challenges	irrigation, and CSA management practices. Develop targeted incentives to
	encourage stronger engagement of producers by downstream actors.
	Standards: Existing Green gram standards and classifications should be
	redesigned to align with Kenya's climate-smart agriculture strategy, in
	coordination with relevant institutions across the sector. Farmer cooperatives
	coordination with relevant institutions across the sector. Farmer cooperatives should receive public support to promote and enable higher quality production
	coordination with relevant institutions across the sector. Farmer cooperatives should receive public support to promote and enable higher quality production through input access and CSA extension training.
	coordination with relevant institutions across the sector. Farmer cooperatives should receive public support to promote and enable higher quality production through input access and CSA extension training. Aggregation: Partnerships between farmer cooperatives and Green gram

Lessons learned in up scaling if any Social, environmental, policy and market conditions necessary for development and up- scaling	<ul> <li>enable access to resilient, high-yielding seeds and other climate-smart inputs.</li> <li>Financial Incentives: Financial incentives can be designed to incentivize private sector, downstream value chain actors to provide services to producers, for example through conditional subsidies. The government may opt to continue its efforts to implement quality-based Green gram payments, including CSA-criteria, while offering comprehensive service provision for producers through public-private partnerships. Building public-private partnerships is key to filling service gaps for smallholders to improve productivity and disseminate CSA practices.</li> <li>When policy instruments and rules are well implemented, there was an increase in productivity of green gram in Kitui County</li> <li>Social conditions – Acceptability of the policy instruments and rules by the smallholder farmers of green gram</li> <li>Environmental conditions – sustainability in green gram production</li> <li>Policy conditions – Lacking specific Green gram policy</li> <li>Market conditions - Poor market infrastructure</li> </ul>

- 4 Farmer accessibility to production inputs
- 5 Impact on Green gram prices

2.13.2 TIMP Nam	ie	County Integrated Development Planning				
Category (i.e.	technology,	Management practice				
innovation or	management					
practice)						
A: Description of the technology, innovation or management practice						
Problem addressed		Low green gram productivity due to lack of centralization of the smallholder agency and voices while planning agricultural development issues in Kenya				
What is it? (TIMP d	escription)	The County Integrated Development Planning is builds a plan for				
		each county in Kenya to be implemented in five years. The planning				
		process is participatory, involving the development stakeholders in the county. It is during this planning period where the issues in Green gram production, marketing and processing are considered.				
Justification		In the Counties where the green gram value chain creates wealth among				
		the smallholder farmers, centralization of the farmers' agency and voices need to be considered during the County Integrated Development Planning. Failure to plan for the green gram production would to less optimization of opportunities				
B: Assessment of dissemination and scaling up/out approaches						
Users of TIMP		• Farmers

5 Adoption of policy options 6 Equity distribution among the stakeholders 7 Productivity levels among the smallholder farmers 8 Farmer accessibility to production inputs

2.13.3 TIMP Name	Policy instruments related to Green gram
Category (i.e. technology,	Management practice
practice)	
A: Description of the technology,	nnovation or management practice
Problem addressed	Low green gram productivity due to the existing policy instruments
	which do not centralize the smallholder farmers' issues in green gram
	production. Therefore, weak policy instruments have led to the market
	failure for both inputs and outputs
What is it? (TIMP description)	The policy instruments are the means to achieve policy objectives. For
	the green gram production, some of the policy instruments include
	subsidy in the inputs and also minimum price for the green gram
	outputs.
Justification	Without policy instruments the green gram productivity will remain
	low. It is very likely that a particular policy instrument, although
	designed to have primarily an efficiency, distributive, or stability effect,

	will also have some impact on the other objectives related to green
	gram production
B: Assessment of dissemination an	d scaling up/out approaches

2.13.4 TIMP Name	Policy cycle
Category (i.e. technology, innovation or management	Management practice
practice)	
A: Description of the technology, i	nnovation or management practice
Problem addressed	Low green gram productivity due to the development of
	agricultural policies not relevant to the problem emergency in
What is it? (TDMD description)	green gram and also without staged follow-up.
what is it? (TIMP description)	The policy process is normally conceptualized as sequential parts
	or stages. These are (1) problem emergence, (2) agenda setting,
	(5) consideration of policy options, (5) decision-making, (5)
	device for new policy development. It is a tool which divides
	active for new poincy development. It is a tool which divides
	complex procedures into convenient and manageable steps. These
	for the service a local day and an educates any
	for the new straight divided into five stages, a sende setting
	<i>cycle</i> is usually divided into live stages: agenda setting,
Instification	When is a policy cycle on appropriate tool for molying policies
Justification	why is a poincy cycle an appropriate tool for making poincies
	notice based on the agricultural problem emergence/issues. The
	policy based on the agricultural problem emergence/issues. The
	should be drafted implemented and assessed. It conves more as an
	should be drafted, implemented and assessed. It serves more as an instructive guide for those new to policy then as a practical
	strictly defined process, but many organizations aim to complete
	solicies using the policy cycle as an optimal model. Policy
	cycle is a valuable device for new policy development. It is
	a tool which divides complex procedures into convenient and
	manageable steps These steps are flexible enough to
	incorporate any changes at the time of new policy
	development and as a part of continuous change once it is
	implemented
